There may even be a third version released. I believe there is work under way for a port of Zoo that is compiled by Lattice C. The programmer is hoping to make a smaller executable than the GNU C compiler makes.

>since there was a quasi-official version posted by our esteemed moderator,
>i suggest at least initially, that we limit ourselves to that version
>ALONE for posting zoo'd archives of any form (well, 2.01 is ok, too). i

>the zoo effort, but i don't. besides i'd rather work on more interesting
>applications (like nroff 2.0 which i just started). i can live with slow/
>big archives, as long as i can unpack them :-(

That's the version I did. I am aware of a few minor bugs and they will be fixed and a new version released in the near future. I'm going to try and wait for Dhesi's "fast compression" version that supposed to be released in the next month or so.

>and it would not be a bad idea to contact rahul dhesi as well once we have
>a working, optimized version and let him #ifdef atarist into the official
>distribution.

Not a bad idea.

>if you do work on zoo, do NOT change the algorithm and do NOT change the
>file format. optimize the heck out of it and even improve the interface
>but do NOT do anything which would render archives unarchivable by the
>"standard" release.

My version follows that belief exactly. All I did, internally, were some optimizations to improve the speed. Everything else (globbing and the -backup code) is done "outside" of zoo. There were no changes made to the zoo code.

I tried zooV21.zoo from atari.archive and it didn't work!
The version from comp.binaries.atari.st is much better. This version is
available at our archive by anonymous FTP or by our Mail-Server.

*****> by anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your email address (you@your_domain)
Usage: see the ftp(1) manual on your system
File: ATARI-ST/utils/zoo.zoo
ATARI-ST/archivers/zoo.ttp
Important: don't forget to set binary mode.

*****> by our Mail-Server program:

1) The Mail-Server can be reached at the address

mail-server@cs.ruu.nl

2) The Mail-Server understands a couple of commands, all commands
must be in the message body. The first thing you might want to
do is ask it for help:

send HELP

3) The Mail-Server will send you the UUENCODED package
if you put the following commands in the message body:

begin
send ATARI-ST/utils/zoo.zoo
send ATARI-ST/archivers/zoo.ttp
end

Note: The zoo.ttp is the binary file in case you don't have an older version
of ZOO to extract zoo.zoo.

From: danny@fiction.ms.sub.org
Message-ID: <rsm499@fiction>
Source record: 47195

Hello!

I'm looking for a description of the new STE joystick ports. Are they also addressable as output ports? Are there new BIOS functions for the port I/O, or, if not, where are the ports located in memory?

Thanx in advance,
Daniel

I just got a mega STe w/internal HD. I used to have a FaST ICD
Hard Drive, I need to get both on line so I can transfer the filee
from my old ICD to the new internal. I can't seem to get the
both of them hooked up and working together.

I was thinking I might need to change some SCSI ID #s???

Any help would be greatly appreciated.

thanks

jansteen@cwi.nl (Jan van der Steen) writes:

|[...] it seems that the system code performs the "cd .." command
|by stripping *one* directory from the current path. However,
|the used algorithm doesn't make sense [if relative paths are passed in].

| Should one only supply full pathnames to the file selector,
| or should the described behaviour be considered a bug?

I think this is a case of "Doc, it hurts when I do this..." As Allan has said, if the file selector misbehaves when you pass it a relative filename, don't pass relative filenames to the file selector. It bothers me when I see programs doing this, because what does "." mean when a program brings up a file selector? For all I know, the program could change directories numerous times for its own devious purposes. How the heck do I know what its idea of the current directory is?

Please use fully qualified pathnames in the file selector. I know that means you can't go very deep, but that's life on one line of a 40 column screen.

hofer@urz.unibas.ch (Remo Hofer) writes:

|Wouldn't this be an idea for a dc week utility. A TSR that parses all pathnames
|before calling the system routine. So these commercial applications will not
|cause problems to anyone.

I'd like to echo Allan's sentiments on this one, too... fixing "bugs" for no other reason than to allow buggy programs to run is A Bad Idea.

Believe it or not, I may even be more rabid about this issue than Allan. I think Atari should do everything in its power to discourage lazy programming. Our goal should be able to point at programs available on our computers and show how easy they are to use, and how robust they are. We shouldn't be required to apologize for the number of auto folder programs that you need to patch various bugs/features/whatevers so that programs X.PRG, Y.APP and Z.PRG can all coexist peacefully.

I think people who write little TSR helper programs shouldn't waste their time writing auto folder patches that let DB Master One run under TOS 6.7. They should spend their time enhancing the utility of TOS machines, so we move forward.

Although there are a number of bugs in V1, I must admit that personally I preferred the user interface design to V2. In particular, I find the click on an object to produce a menu and then click again on the menu choice required is extremely fiddly. Unfortunately it seems to have also found its way into the Extensible Control Panel too... This attempt at being different from the Mac just seems to make things more awkward.

3209. Gemdoss 87 -- Fdatime!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-10 12:46:30 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <8ZRg71w164w@ersys.edmonton.ab.ca>
Source record: 47197

I have a problem, and this seems like the appropriate area to ask for help. I need to know what the proper format (and use) of the Fdatime command from Gemdos is. The books I have tell me this:

Fdatime does not return an error code, and requires three parameters. The first parameter is an array of two integers, with the first integer in the array representing the date and the second integer representing the time. The integers of SHORT. The second parameter is the handle of a file openeed with Fopen, and the third parameter is a flag which tells the system to SET the date and time stamp of a file when it is 0 and GET the date and time stamp of a file when it is 1.

This is all well and good, but it doesn't work. A friend of mine with a GFA manual tells me that I have to have the first parameter as a single integer, but then how would I set the date and time? Wouldn't they conflict with eachother? The method of setting the date and time in their respective integers (mentioned above) that I used was like this:

```
Buf [1] = Shl (Year, 9) | Shl (Month, 5) | Day ;
Buf [2] = Shl (Hour, 11) | Shl (Minutes, 5) | Seconds DIV 2 ;
```

Year is the current year - 1980. The above lines are meant to give you an idea of what I did. I write in Pascal, but the help I need woulf be greatly appreciated in any language (other than Assembly, which I don't understand...<Grin>).

It is really annoying that Atari gave me a 4-year old manual with my
1040 STe that doesn't not tell anything about the new features of STe.

Ken, "." is Atari's terminology, not mine. I didn't make it
up. Actually Atari didn't either, but according to your literature
you support it. If you're going to support something, then do so.
This seems to be something I keep saying year after year to many
companies. If at all possible, do what you say you are going to do.
Call it "integrity", call it "dedication", call it "honour", I don't
care. But if you say you're going to do something, then do it.
Otherwise, don't say you're going to do it.

As for what "." means, it means what it says. :-) Go look it
up in an MS-DOS manual. That's the system you people seem to be
emulating. Or look it up in a Unix manual. I'd prefer that you got
past this MS-DOS silliness anyway. Or better still, look it up in
an OS-9 manual. I like OS-9. :-)

>could change directories numerous times for its own devious purposes.
>How the heck do I know what its idea of the current directory is?

Well gee Ken, when you start up a program like "ed" in a Unix
system, how do you know what the current directory is for that
program?

>Please use fully qualified pathnames in the file selector. I know that

Overall, I disagree with your reasons, but I come to the same
conclusion. I think the better statement for not creating yet another
patch is because you just end up causing confusion. Look at this
mess we have with GDOS. Some people have it. Some people don't.
Some programs run with it, some don't. Some times I get bombs because
I booted with a German GDOS and either the system or a program can't
find its fonts. And then there's the Pool Patch and the Rainbow TOS
patch -- enough. End users want to run applications, not go hunting
around BBS's for patch programs and then piecing them together.

>Believe it or not, I may even be more rabid about this issue than Allan.
>I think Atari should do everything in its power to discourage lazy

>We shouldn't be required to apologize for the number of auto folder
>programs that you need to patch various bugs/features/whatevers so that
>programs X.PRG, Y.APP and Z.PRG can all coexist peacefully.

Well, again, I have to disagree with something of your reasoning.
Programmers have better things to do than waste their time trying to
get around system bugs. But the real solution is for you guys to
bring out a more bug-free version of TOS in ROM, so we can get rid
of at least the Pool patch and the Rainbow TOS patches.

You know, I've owned over a dozen computers, most on different
systems (unique from each other), and only 2 Atari products (the
Portfolio and the 1040ST) and you know, the *only* 2 computers I
own that *need* system patches are the Portfolio and the ST. That's
not to say that all the others were entirely bug free, but the bugs
in the others (sometimes after revisions) were *so* obscure that
often I could run any major program on them without problems. That
is the kind of performance I expect at this stage -- 5 odd years
after I bought my ST. Yet here I am with this TOS 1.4 ROM set.

>I think people who write little TSR helper programs shouldn't waste
>their time writing auto folder patches that let DB Master One run
>under TOS 6.7. They should spend their time enhancing the utility
>of TOS machines, so we move forward.

Well that much is what we all want. So the first step should
be to fix the bugs and bring out a set of ROMs that lets me get
on with writing applications. That and a good set of manuals.
But that's Lattice's problem right now. :-)

3213. GCC question

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-11 06:54:59 UTC
From: michael@dime.cs.umass.edu
Message-ID: <34657@dime.cs.umass.edu>
Source record: 47203
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This is probably a silly question, but I've installed GCC on my system and can't get it to compile anything, so I'll ask anyway.

The problem is how it is treating TOS filenames. If I try to compile using a command such as

gcc -O -c test.c

then it will not see the file. If, on the other hand, I try to compile with

gcc -O -c TEST.C

then it DOES see the file, but it doesn't seem to know what to do with the .C extender, so no actual compilation takes place.

Is there a switch or an environment variable I can use to correct this?

Thanks in advance,

Michael Kieras

Actually, the book had it reversed. My information came from Tackle Box ST, and is usually accurate. Unfortunately, it wasn't this time. The TIME should come before the DATE, and the integers don't have to be shifted at all. You can get the integers for the time and date from the tgettime and tgetdate functions if all you want to do is "touch" the file. Thanks for you help...

Drvmap returns a bitmap of the available drive so to test is a particular drive exists you have to AND the bitmap with the mask for the drive you are testing. If the drive exists the result is non zero if it doesn't exist the result is zero. Its as simple as that.

Finally a quick example:

SAY drvmp returns 15 This indicates drives A,B,C and E exist. So to test for drive A you simply and with, 1 to test for B and with 2, C and with 4 and So on.

The problem with drvmp is that if A exists B will exist also even if there is only one physical drive on the system with TOS emulating two by asking for disk swaps. As to how you would try to detect the physical existance of a second flopy
I don't know.

The number that you get from Bios 10 (the Drvmap function) will return a
decimal number. You need to convert this number to binary, and from
there you will find out which drives are active (the leftmost one being
"A" drive). I hope this helps, Mike.

Help! Double Click Software is looking to borrow an ST equipped with AT-SPEED
for use at the Atari Messe in Duesseldorf.

We will need to borrow the machine for the entire show. We will provide any
helpful individual with a free pass for all days of the show, plus a copy
of our software packages.

We can arrange to pick the ST up if it fits in our travel plans. We will be
in Frankfurt, Munich, Wiesbaden and Duesseldorf before the opening of the show,
but we could travel by train to get the equipment.

Please reply in EMAIL to:

uace0@menudo.uh.edu <-- (that's a zero - uace0)

If you can help us out. We would **greatly** appreciate any help.

Thank you. And now back to the news.

- mike

Well there is _nflops $4a6.w = 0 or 2.

Then there is _drvbits $4c2.l, this is a bit for each drive,
so drives a/b will = 3, and a/b/c will = 7...etc..

Does that help..

>> I don't know.

That's simple. There's a system variable at $4a6 (called _nflops), word size,
which is set to the number of floppy disk drives connected to the system at
boot-up time. If you find 1 in _nflops, drive B: is a fake, if you find 2
or a higher number, it's real.

Anyway, I don't think this part of the problem is relevant to the original
poster's question 8-)

|>swaps. As to how you would try to detect the physical existance of a
|>second flopy
|>I don't know.

|>Dave.

That's easy. The documented system variable _nflops at $4A6.W gives
the number of floppys connected to the system. (0,1 or 2)
So you check it (in supervisor mode) and use the result as a mask against
the result returned by Drvmap.
I then ror the result for each possible drive and call the space checking
routine according to the state of the carry flag.

A small example entered with d5.L holding the drvmap result after masking :

```
move.w #15,d4 Number of possible drives-1
loop:
ror #1,d5
bcc nodrive
.....(your space check routine here. 15-d3 is the drive number)
nodrive:
dbra d4,loop
```

etc.

Hope this helps.

Regards
John.

3223. Noisetracker Source Needed

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-12 10:39:06 UTC
From: Al_Crawford@edinburgh.ac.uk
Message-ID: <15969@skye.cs.ed.ac.uk>
Source record: 47216
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know if there exists such a thing as a Protracker compatible Noisetracker (a la The Empire Noisetracker) for which source code is available? I'm currently in the process of developing a game and it's intended that it should have copious amounts of wonderful music. So far I've managed to find some (possibly erroneous) documentation on the Protracker file format and the source for a Noisetracker, which I had intended to use as a guide from which to develop my own tracker for embedding within my program.

However, having spent several evenings analysing and commenting the source I've come to a couple of conclusions. 1) It doesn't work due to some (correctable) bugs. 2) It's very obscure re the techniques used in the arpeggiator, portamento up and down features and 3) it uses a lot of self-modifying code, a crime punishable by death in my books.

So, does anyone know where I might find source for something more useful? I don't intend to use it directly in my program, but with an example of a working tracker it'd make writing my own a lot easier (esp w.r.t. the translation between 4 voice Amiga and 3 voice ST sound).

Ta,

Al

I have made a program which starts zoo, lzh, uudecode, arc or zip with the system() call. The program is fine on the Gemini desktop. I can drag whatever archive file I want on it, and it will be extracted.
If there is some interest, I can send it to atari.archive.....

```

Please don't mess around with system variables or BIOS to get information about existing *GEMDOS* devices -- these are different thinks. Use the 32 bit return value from Dsetdrv(), as in:

```
unsigned long drivemap = Dsetdrv (Dgetdrv ());
```

```

I agree with Bill. My initial posting stated that the one posted to
the newsgroups worked better than the one on atari.archive. Since it
seems that people might have missed to *better* version (officially
condoned by our dear software moderator) I have placed both source and
binaries on laas.laas.fr [140.93.0.15] in ~ftp/pub/atari.

Enjoy!

Drvmap is the routine to use. It returns 32 bits, one for each drive. Drive A is bit 0, drive B is bit 1 etc. If a bit is set, the corresponding drive exists.

In C, use the following routine:

```
checkdrv(d)
char d;
{
return Drvmap()&(1L<<(d-'A')) ? 1:0;
}
```

This returns 1 if drive d is present and 0 if it's not. d must be an uppercase letter. So, to check for drive B:, use checkdrv('B').

I'm afraid you'll have to access a system variable. _nflops at 0x4a6 contains an int with the number of existing floppy drives. Be sure to switch to supervisor mode before accessing.

```
nflops()
{
long ssp=Super(0L);
int r= *(int*)0x4a6;
Super(ssp);
return r;
}
```

does the job.

3231. acquiring a CDC Wren III

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-12 21:11:56 UTC
From: guus@kouyzer.hobby.nl
Message-ID: <0886268@kouyzer.hobby.nl>
Source record: 47222

I have the chance to buy a CDC Wren III drive rather cheap. My understanding
is, this is a 150 Mbytes SCSI drive, 5.25" full height.
I would like to know wether there are any known problems with this drive
in combination with an Atari 1040ST in general and/or with certain (or all)
SCSI host adaptors.

replies by e-mail, please

3232. Recongnizing Drives: Conclusions!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-13 01:35:17 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <iXgL71w164w@ersys.edmonton.ab.ca>
Source record: 47220

I posted an article recently asking for help with determining whether or not a drive was connected. I received many suggestions, but the clearest and easiest to implement was the following.

[Pascal Code. Variables, Procedure Declarations, and Function Declarations removed.]

```
Known_Drives := Drvmap ;

If Shl ( Known_Drives, x ) <> 0 Then

Begin

WriteLn ( 'Drive "X" Connected!' ) ;

End ;
```

x is an integer between 0 and 15. 0 corresponds to drive A:, 1 corresponds to drive B:, and so on. A Peek to location $4A6 will return the actual NUMBER of drives connected, but not which ones. This value helps determine whether there really is a drive B:, or whether TOS is just simulating it with the "Please insert disk B into Drive A:" messages.

I hope this helps out others who may be interested, since the available documentation is fairly sketchy about this call. Thanks to all of those who helped me out with this problem.

3233. Can someone explain Atari fonts to an Amiga/Mac person?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-13 01:57:56 UTC
From: rodent@netcom.COM
Message-ID: <1991Aug13.015756.5540@netcom.COM>
Source record: 47218

What i need to do is create my own 7x11 pixel font and write a program
that will utilize this font either on the screen or preferably in a GEM
window. I have lots of Amiga/Mac experience and this is a simple thing
to do on those OS's... how do i do it on an Atari? This would require
A. a simple font editor
B. C code to open and draw with the font

I have a TT030 with big disk and plenty ram and Lattice C. I am not looking
to do fancy scaled,rotated text, just a simple, small, bitmap font.

Help of any kind is appreciated.

Ben Discoe, radical ecologist, computer scientist.

I don't think this will work, things have been moved, and if its for games,
no way at all, games for one reason or another are not normally programed
to be relocatable, they would end up overwriting TOS.

TOS from a disk is loaded in the lower part of memory..

> 2.8. I'm curious why you would prefer an outdated (and buggy) version.

I don't know 2.8, but with 2.0 I ran into a few problems I didn't have
in 1.4 (eg. the buffer for images was too small for me (no overflow
checking?) and I patched 1.4 to have virtually unlimited buffer space).

I also didn't like the new interface (maybe just a matter of getting used
to) and never needed extended objects.

Version 1.4 is (almost) free. What about 2.8 ?

3236. 1040 STf Floppy failure... Fatal?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-13 08:44:20 UTC
From: laverman@cs.rug.nl
Message-ID: <1991Aug13.084420.1884@cs.rug.nl>
Source record: 47225

Dear All,
It's probably hopeless, but I'ld like to ask y'all anyway. (See how desparate I've become? ;-) :-()

A few months ago I had this weerd problem with my Floppy drive (standard 3.5" 720Kb), where it didn't seem to get anything of my disks. I tried re-inserting the disk, shoving it in under all possible angles and at several different speeds, and at last it worked again. It didn't happen again, so I forgot about it.
This weekend, when I wanted to make a HD backup, and wanted to start by formatting some new disks, it failed again. This time I started listening and looking closer, and I discovered that the motor/floppy actually refuses to rotate. I re-booted with my usual work-disk (My HD is 100% Minix, so when in TOS I'm Floppy only...) which worked fine. Retry formatting.. failure... Other disks from same package: still no go.
Tally so far: All disks from this package (by a company whose name - when uttered vehemently - could be misinterpreted as meaning 'nonsense') are refused. Some seem to rotate, but only very slowly... Other disks at first either rotate or don't. Retrys later on give the same result for the same disk.
Then yesterday 'good' disks started stopping.

Let's say that I'm 'annoyed'. This is a strong understatement, but swearing in public seems unadvisable.
I disassembled the drive as far as I dared (which already included the removal of some green-plastered bolts, but anyway) and I cleaned it. After this some disks started rotating again, but most still stop.

I'm quite at the end of my wits here. The name of this newsgroup seems to indicate that this is the place for technical questions, so how about it?

Anybody got a clue?

P.S. Somebody told me to take a look at e.g. the write-protect detector's parts, as well as other small rings, etc. This was why I opened it up yesterday. Everything seems to be in order.

Now, the problem was (correct ME if I'm wrong) that Dsetdrv _always_ claims
that there is a B-drive, whether it is logical or physical. The original
question concerned detecting a *physical* B-drive.

Besides, why not use the system variables ? They are documented, and extracting
interesting information from them should be legal, not so ?

Double Click's DC Shower will also extract or list most known archive formats,
as well as provide an enhanced text reader, hex dump facility, and picture
viewer. Very reasonably priced, too.

> Does anyone know how to test to see whether a drive exists or not? The

Here is some code I use in my program SYSINFO:
Note that is not completely save since some TOS versions do not clean the
drive map on reset or assume that removable HD's are never empty.

This leads to the following problem if a drive is accessed that is not
available but its bit is on in the drive map the critical error handler is
trickered and a dialog box will appear with a message like
"Drive X: is not responding check and insert a disk"

But that will lead to a completely different story
---------------- cut here -----------

```
#define _NFLOPS (int *)(0x4a6L)
#define _DRVBITS (long *)(0x4c2L)
#define biton(n,m) ((1<<n)&m)

main()
/* this code is never tested in this form, no warranty is given at all */
{
int k,_nflops;
long ssp,_drvbits;
char drives[2*15+1];

ssp = Super(NULL);
_nflops = *_NFLOPS;
/* _nflops will tell you if there is a physical drive B (_nflops == 2) */
_drvbits = *_DRVBITS;
/* you could use _drvbits = (long)Drvmap() */
Super((void *)ssp);

for (k=0; k<16;k++)
{
drives[2*k] = ' ';
drives[2*k+1] = biton(k,_drvbits)?('A'+(char)k):' ';
}
drives[2*15+1] = '\0';
printf("\033E Drive information\n");
printf("Drive map: %s",drives);
printf("floppydisks: %d",_nflops);
}
```

Not to mention (ok, so I am mentioning) that it also plays digitized sound
samples (on STe uses DMA or yamaha sound). Only $29.95. Also, it works from
any GEM program, can be called with a command line, used as the replacement
text file viewer in NeoDesk 3.0, or called directly from UIS 3.3 (using its
show feature), as well as completely replacing the GEM desktop show function.

It is not nearly as powerful as DC Xtract Plus, and is only designed to do a
verbose list or extract everything. It is being updated to handle the new
zoo and lzh formats (DC Shower and DCX+). ;-)

Sorry, couldn't resist... Have a nice life.

3241. How about the GDOS for outline fonts?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-14 08:21:58 UTC
From: reeuwijk@dutentb.et.tudelft.nl
Message-ID: <1991Aug14.082158.5590@donau.et.tudelft.nl>
Source record: 47230

I have read several rumours about a new GDOS from Atari that would
support outline fonts. Does anybody know more about this?
When/if and how will it be released? What are the technical specifications?
Is it true that the outline fonts will be in Adobe type 1 format?

Please respond to the net, I think more people are interested in this.

>question concerned detecting a *physical* B-drive.

Actually, I think that the question just asked what the "right" way is to find out if a drive exists. I would have to agree that using the return value for the Dsetdrv() call is best; using the BIOS Drvmap() call is second best; and using the system variable of connected drives is the "worst" method (see below). Of course, if you really *have* to know whether or not drive B is a logical or physical drive, then you have to use a system variable; but very very few programs really do need to know this.

>Besides, why not use the system variables ? They are documented, and
>extracting interesting information from them should be legal, not so ?

Legal, but perhaps not wise. The next version of MiNT, for example, will probably provide a way to remap unused drives; drive P: may actually refer to the folder C:\FOO\BAR. This remapping will be done on a per-process basis. Since the BIOS system variable reflects the existence of physical devices for the whole system, drive P: would not be recorded in it. It *would* be marked in the return from Dsetdrv(), though, if the particular process making the Dsetdrv() call has the remapping in effect.

Thus, programs that use the system variable would never allow the user to select drive P: (for example), even though opening a file on "drive" P: would be perfectly legal.

Other multitasking systems may do something similar. And maybe someday there will be a multitasking TOS. I would think that Atari has provided Drvmap() and the return value from Dsetdrv() for a reason; and if there's a system call that returns a value, then that should be used in preference to a system variable (IMHO).

(Besides, using a system call means that you don't have to switch to
supervisor mode to access the system variables!)

(2:320/100.1) writes:

m> On a similar note, has anyone heard of a program called WHATARC?

Yes it is a shell (no GEM) used for extracting en compressing mail packets in
fidonet. Although the extracting part could be used in any environment.

Normally the mail packers would call arc.ttp to archive or unarchive mail
packets. There are however better compressors. The only problem is that you
cannot see what type of archiver is used just by looking at the file name.
This is where Whatarc coms into to place. Instead of arc.ttp Whatarc.ttp is
called. It decides what kind of archive it is and runs the right archiver for
it. The commandline parameters are programmable in the whatarc.ctl as you have
seen) so any archiver can be used.
Currently whatarc is capable of extracting:
ARC
LZH
ZIP
ARJ

It has too look at the file to find out what type it is, it doesn't matter if
a new compression format is used (LH5/LH1 etc.) that is up to
de-archiving program to decide.

For packing whatarc uses a list of which fidonet nodes get what kind of mail:

SEND 282/301 LZH
SEND 282/1 ZIP
etc.

This works only in fidonet because it has to see where the mail packet have to
be send.

But as I said the unarchiving part can be used in ANY environment, so you
don't have to bother when unpacking.

About ARJ, there is currently only an Unarj. ARJ archiving support was built
in for the future.

The variables are documented. However, if I remember my internals book correctly, the offsets are not defined, i.e. you would have to build on a new machine (or hook into the system symbol table) to have the correct offsets. Building on a new machine would mean creating a new offset table and then re-compiling/linking, I believe.

The reason BIOS, XBIOS, and GEMDOS are available is to hide the operating system internals. It is always better, in any programming environment (IMHO), to use system call interfaces instead of system variables. It is a matter of where the interface is defined for a software system (generally now adays we place these interfaces in procedures, not in variables).

Note I'm not saying don't do it, just understand the architecture involved and what the whole set of tradeoffs are.

Have fun - Bob Hays

|>Kees van Reeuwijk

There is indeed a new outlie font version of GDOS due out very soon now.
This GDOS is known as FSMGDOS which I think stands for Font Scaling Module
Graphics Device Operating System. The package is in beta test at the
moment and at least one package is due for imminent launch using FSMGDOS.
This package is Word Flair II I believe. Judging by the beta release
FSMGDOS the output quality is very good and facilities exist to make it
backwardly compatable with the old GDOS system. The font system is fully
controlable and provide for full rotation and sheering, My only real
complaint is that the initial drawing of the character is a little slow,
but this is livable with because like calamus FSMGDOS caches characters
that have been produced to speed up subsiquent use of that character.

I do not know what the font format is but I would love to know if anyone
has any ideas.

As for availability, I think it will be provided free with the new Atari
computers that contain Hard Drives and will also be available from some
packages such as Word Flair II. The major advantage of the new FSMGDOS is
it looks like programmers who use the new system will not have to apply
for a licence that used to cost lots for the old GDOS. I hope this will
encorage the distribution and use of FSMGDOS.

Finally I would like to thank the programmers of the new system for a job
well done. I think this is one of the better pieces of software to come
out of Atari in recent years.

Posting this for a friend - I do not read atari newsgroups so please reply
by e-mail - thanks.

Sorry if this is a frequently asked question...

Is it possible to modify and/or obtain a gadget/widget to enable an STF to be
connected to an ordinary TV set so as to use the Low and Med res modes.
Any info gratefully received.

Ralph.

3247. Why *3* DMA Sound Address Registers ?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-15 15:26:16 UTC
From: redmond+@cs.cmu.edu
Message-ID: <1991Aug15.152616.112621@cs.cmu.edu>
Source record: 47235

I'm having trouble getting the DMA sound to work on my STE.

Basicly, the problem lies with the three address registers,
listed in the docs as:

FF8902 R/W Frame base address (high)
FF8904 R/W Frame base address (middle)
FF8906 R/W Frame base address (low)

Suppose my data starts at snd_addr and is snd_len bytes long -
what should I store in these locations ?

By various experimenting, I've got fragments of my sound, white noise,
zip, and occaisionally, but not repeatably, all of my sample!

Any help would be appreciated!

Thanks in advance,

Red/.

3248. Re: acquiring a CDC Wren III

Newsgroup: comp.sys.atari.st.tech

[I also post this to the net becuase I think it's a warning which should
be made public]

In comp.sys.atari.st.tech you write:
>I have the chance to buy a CDC Wren III drive rather cheap. My understanding
>is, this is a 150 Mbytes SCSI drive, 5.25" full height.

Right.

>I would like to know wether there are any known problems with this drive
>in combination with an Atari 1040ST in general and/or with certain (or all)
>SCSI host adaptors.

I have to disappoint you:
I tried a CDC Wren III with an ICD Host Adaptor and got worse results:

It doesn't do interleave 1, interleave 2 is faster, so it's ~450 k/sec/phys.
It produced write-errors with one special bit-combination.

Now I'm running it with an old Atari SH204 Host and it works, but I didn't
manage to get it up to interleave 1.

You should try to get the larger one, is the same but 330 MB and runs
with Interleave 1 (1100 k/sec/phys).

Greetings, Bjoern

Can anyone help me out here? I own one of the first 520ST's with TOS in ROM (tos 1.0) and I haven't had access to usenet or any major atari news for a few years.. If my questions take too much bandwidth to answer then please mail me, but I have a feeling that others would also appreciate these answers..
First, What is minix? Is it PD? And I've seen some message that said you could run amiga and atari st binaries? Is that true? And can you run unix? is it included? How compatible are all these things?
Second, what are the absolute best programs (PD and other) that would be good to get? I need to get my ST up to date. I'm considering a 520 to 2.5 meg upgrade, but I'd like to know what's out there..
Third, I've read in magazines that Dave Small had such a problem with people copying a software mac emulator that he made older versions PD.. Is this true? And where can I get PD versions of it?
Fourth, Is there a good PD (and ANSI standard compatable) Personal Pascal editor/~rc}
gIo?'Fompiler? I have Lattice C for the ST, but next year in Highschool I'm taking a class on pascal, and I'd like to be able to continue my work at home.. Thanks!!
Also, anything else that an ST user should know, please tell me! Like, how does one get a TOS upgrade to 1.4 or whatever the highest version is? Is it on disk, or cartridge?

3250. Bug in TOS1.04/TOS1.06 (GEM)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-17 22:27:57 UTC
From: micro@imada.ou.dk
Message-ID: <1991Aug17.222757.1985@imada.ou.dk>
Source record: 47242

While debugging an autofolder program, the system began to CRASH when the desktop came up. If I have had any dubious ACCs in my system I would have archived (:) them, and thought no more about that. The problem were that the only ACCs I had active were :
JUKEBOX, TREEVIEW, XCONTROL.

These are all well polished programs, that I rank very high. (I wrote one of them, and _use_ the other ;-). And to make things even worth, any combination of two of them gave bombs...
After 30 hours of hacking I came up with a program that could Crash the system.
The problem appears to be that if a program (in the autofolder) writes something in the memory that the desktop later allocates, and there is at least two ACCs, then the DESKTOP bombs EVERYTIME!!

```
----------------------->8--------------------------- PROBLEM...
#include <tos.h>
unsigned short Screens[160000L];

main()
{long l;
Cconws("Press SPACE to write GARBAGE into TPA");
if ((Cconin()&0xff) == ' ')
for (l=0; l<160000L; Screens[l++] = 0xAA55);
}
```

This program fills the lower part of the TPA with 0xAA55's. Try to put this program into an empty autofolder and have some ACC's active. This should bomb the System. Even more interesting is it to have a debugger resident when this happens. BugaBoo says :
"AddressError, from $FDD5E0, writing in $AA55AA55+8"
on my scandinavian TOS1.04.
The routine starts at $FDD5B0, and the interesting part is :

```
$00FDD5B0: LINK.W A6,#$0000
MOVEM.L D7/A3-A5,-(A7)
MOVEA.L $0008(A6),A5
MOVEA.L $000C(A6),A3
SUBA.L $00006FF8,A3
MOVEA.L $000C(A6),A0
MOVEA.L (A0),A4
MOVE.L A3,$0008(A5)
MOVE.L A5,$0004(A3)
; here the fun happens...
MOVE.L A4,$0004(A5)
MOVE.L A4,D0 ; is A4==0L?
```

```
BEQ $00FDD5E0 ; yes, then it's not a pointer
>>> MOVE.L A5,$0008(A4) ; no, then lets write...
LINEF { RTS D7/A3-A5 }
```

The problem is that A4 points to 0xAA55AA55, that's memory - right?

Now try to put this in the autofolder, after the C-program...

```
----------------------->8--------------------------- FIX...
.TEXT
clr.w -(SP)
trap #1 ; Ptrem0
.END
```

If you don't set it to fast-load, it should clear the TPA.
And no bombs...

-Klaus

3251. Personal Pascal VS. Modula - 2

Hello, again.

I've written a program in Personal Pascal that seems to use far too much memory. I've heard that the Personal Pascal compiler is less than efficient, so I was thinking of converting the program to Modula - 2 by TDI. I've never used Modula - 2 for any practical purpose, so I'm not sure how good the compiler is, or even whether or not it is better than the Personal Pascal compiler. I am looking for people's opinions on the matter, since the program is over 7000 lines of source, and converting it to Modula - 2 would be an agravating experience if I didn't get a significant benefit out of it...:) Has anyone used these two compilers? If you have, I would be glad to here from you. I'm not overly anxious to convert it to C, since I know very little of how to use it, which could be unpleasent...:)

>Is it true that the outline fonts will be in Adobe type 1 format?

Yes, it does exist and is called FSM-GDOS. Atari announced that they will
release FSM final in the next couple weeks. The betas that we have are great and
very stable. This GDOS is based on the Ultrascript code but contains only
the Font rendering. Also included is a full set of printer-drivers
for 8- and 24- pin printers as well as several laser printers.

The package will come with the complete Lucida type familie, and
two CPX/DA's that let you configure the preloaded fonts and switch printers.

Any GDOS program should work with the new fonts, but needs to be upgraded
to use the special features that FSM offers. The fonts are the
Ultrascript PC fonts, but I have not tried to use any yet.

Registered users of Wordflair will be able to get the complete FSM package
from Goldleaf Publishing for ~ $50. If you need more information
call Robert Engberson at 415/257-3510.

From article <i4iu73w164w@ersys.edmonton.ab.ca>, by mforget@ersys.edmonton.ab.ca (Michel Forget):
> I've written a program in Personal Pascal that seems to use far too much
> memory. I've heard that the Personal Pascal compiler is less than
> efficient, so I was thinking of converting the program to Modula - 2 by
> TDI.

I wouldn't think that Personal Pascal is unefficient. I'm just converting a ~6000 line program from Personal Pascal to Turbo Pascal under MS-DOS (which is said to be fairly efficient). The resulting object code is about the same size (100K) on both compilers. No big difference in execution time.

Don't expect too much of an improvement by converting to Modula-2 or any other high-level language. (especially if you are not too familiar with that language!)

unknown@disk.uucp (unknown) writes:
> First, What is minix?

A mini-UNIX for ST, PC, Mac, and Amiga. It's a clone of v7 UNIX, completely re-written from scratch; it's now migrating towards ANSI C and POSIX compatibility. You get a proper multi-user multi-tasking UNIX-compatible operating system with full source code for everything except the C compiler and one of the editors. (You can get the sources for a compiler and for the editor via the net, so that's not too much of a problem.)

> Is it PD?

No, although the license agreement is one of the least restrictive I've ever seen. (Full marks to Prentice-Hall!)

It's about $180. I've just switched from TOS to MINIX and I consider it to be worth every penny... Be warned that it's a hacker's OS; you are expected to know quite a bit about UNIX and feel happy playing with the source code of your OS.

> And I've seen some message that said you could run amiga and atari st
> binaries?

You can run Amiga and Atari ST *MINIX* binaries on either system. You can't run GEM/TOS or AmigaDOS binaries. MINIX is an entirely new OS which completely replaces TOS/AmigaDOS.

> And can you run unix?

It *is* UNIX.

> Third, I've read in magazines that Dave Small had such a problem with
> people copying a software mac emulator that he made older versions PD..
> Is this true?

It's true that people were copying it.

> And where can I get PD versions of it?

I wouldn't bother. You'll need 128K ROMs to run almost any good Mac software these days, and for that you need Spectre.

> Fourth, Is there a good PD (and ANSI standard compatable) Personal
> Pascal

There's a Pascal from HiSoft which claims to be compatible with Turbo 'Pascal'. There are various other Pascals, but I don't know of any standard Pascal for the ST.

> Also, anything else that an ST user should know, please tell me!

Er... that an Amiga is fifty billion times better? <--- joke

> how does one get a TOS upgrade to 1.4 or whatever the highest version is?
> Is it on disk, or cartridge?

It's on ROMs. You have to take your ST to bits with a screwdriver and pliers.

3257. Re: SCSI <=> SCSI II

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-20 09:14:54 UTC
From: ford@tharr.UUCP
Message-ID: <2554@tharr.UUCP>
Source record: 47252

From all the literature I've read, SCSI (the proposed iso standard version with a funny number) is a sub-set of SCSI II, ie SCSI I devices will work with all SCSI II controllers which can identify SCSI I devices.

SCSI I controllers should be able to control SCSI II devices, but at a reduced performance than the same devices would have on a SCSI II controller.

Note, I use the word SHOULD. As with all standards people just love to add things to make them BETTER. Because of this, some SCSI I devices will not work with SCSI II controllers because the extra features conflict with SCSI II instructions. This also applies in the reverse direction, ie some SCSI I controllers make use of "features", and are therefore incompatable with SCSI II devices.

I'm sorry I can't be more specific, but that's how it is at the moment. The only real way to find out whether a drive will work with a certain controller is to suck it and see.

3258. Uniterm Problems (Revisited)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-20 11:00:34 UTC
From: 72347.2767@CompuServe.COM
Message-ID: <910820110034_72347.2767_EHA28-2@CompuServe.COM>
Source record: 47247

A few weeks ago I sent a series of messages about problems I was having with Simon Poole's Uniterm exiting with BUS errors whenever I was connected to a Vax using EVE or EDT in full-screen mode and I pressed the Return key.

I got numerous replies all basically saying it must be my imagination. Well, through a series of debugging routines and by wrapping Uniterm in a shell, I discovered that the culprit was the fast-load bit. When I got the program in its original package, the fast-load bit was set. Memory was not being cleared. There seems to be a routine in the code that references Malloced memory and assumes that any value other than zero means the memory contains a pointer to a valid address. The code is called only when the history buffer has zero bytes space and the SLE is off. Since turning off the fastload bit and turning on the SLE, the problem has vanished.

I just thought I'd send this note in case anyone using Uniterm has seen these errors and may have the fastload bit set in their version.

Like the respondents to my original message, I like Uniterm--I've seen nothing on the MS-DOS machines that approaches it for ease of use in programs such as ALL-IN-ONE.

3260. Supra Clock

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-20 12:44:25 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Aug20.124425.6526@actrix.gen.nz>
Source record: 47249

Supra Clock Problems.

Well I have managed to get the Clock working in my Supra host adapter,
I did ring Supra to find out what IC they had changed to, but all they
would/could tell me was that it was a Dallas chip..

Well I had a look at the Data book of Dallas Clock chips and found
that it could be one of 2 clock ics, DS1285 or DS1287..

Note: The DS1287 has the Battery and Crystal inside, the DS1285 uses a
external Battery and Crystal oscillator.

Both are claimed to be replacments for the MC146818/CDP6818, that is fitted
to the Supra host adapter, but not so much as with the DS1285.

A help to the Net did not get any help at all, I wanted to find out the
Dallas chip No. that Supra was using in the newer Supra Drives/Host Adapters.

Well I contacted the NZ distributors for Dallas, and found that the only
one that they had in stock was the DC1287, at some $32NZ, would cost about
$12 in the USA..

Well I found out you can just remove the MC146818/CDP6818 and plug this
replacment ic, in.

Note: this Dallas clock ic, is a lot thicker than the original ic, but
this does not cause a problem.

Note: pin one is marked with a Dot, and faces away from the drive connector

The DS1287 has a 10 year battery life from the date of use, and with a
accuracy of +- 1 minute per month..

The DS1285 could be a cheaper option, but could not get this chip
that easy to test this theory.

3263. ST reset problem - HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-20 14:14:04 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Aug20.141404.27593@magnus.acs.ohio-state.edu>
Source record: 47253
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently made several modifications to my Mega2+2 ST. It was working fine before this...

1) I got the ISAC card and found out that I needed TOS 1.4 (naturally I was not told this before ordering, seeing as TOS 1.2 is the standard chip set I thought it would work, how silly of me to think a product made for Megas would work in one...) Anyway, I installed TOS 1.4, but had to go from the 2 chip set to the 6 chip set since that was all the store had & I'm generally impatient. This includes removing one chip from the motherboard, installing one standard jumper, and moving two jumpers with (I believe) a capacitor on each. This went off without a hitch.

2) Next, I actually installed the ISAC board, It looks great! (in fairness, I should also say that I also had major monitor problems; The monitor I had supported the scan rates I was given for the ISAC board, but it still did not work, I had to get a new one, and also had to get an ST monochrome because there were so many software problems. Then, Monochrome mode on the ISAC kept coming up RED and WHITE instead of B&W, took me about 2 days to manage to fix that). However, I am very impressed with the board, it looks really nice, although it is a little slow in color mode.

3) The other modifications currently in my Mega are:
AdSeed
Overscan

NOW, THE PROBLEM:
The ST starts up and runs fine. Everything works as it should for about 1/2 hour. Then, I start getting more and more frequent crashes. The first sign is when I access a menu bar and the menu stays down & I get bombs. Then it will start to crash so often it is unusable until I shut it off and let it sit for about 1/2 hour and cool off. Then it works fine again. I am guessing that this is heat related since all the symptoms point to this. I did not have this problem with just AdSpeed & Overscan. I am thinking that possibly I got some bad ROM's. I've also heard of problems with some other chips in the Megas. I have eliminated the possibility of it being a software problem, I know it is hardware. If anyone knows:

1) What the problem may actually be (seeing as my diagnosis may be complete crap because I very well may not know what I'm talking about)

2) How to fix whatever this problem may be (any suggestions short of "throw your ST out the window down to the street several stories below and watch it get run over by large moving 4-wheeled-internal-combustion vehicles out of sheer frustration and general disgust", would be greatly appreciated).

3) Assuming that it is a heat problem, does anyone know of a replacement fan with a much higher "flow rate" that would fit in the same place? Anyone else out there ever installed another fan in some other location on their Mega?

Thanks for sitting through this way too long explination of a *hopefully* simple problem,

Well, Personal Pascal is inefficient. I saw it compared to High Speed
Pascal recently, which produced a faster, smaller program in less time.
Personal Pascal doesn't even try to optimize your code, it seems. I
decided not to convert to Modula-2, though. I'm trying to learn C, and I
may end up converting it to that at some later date. That isn't why I'm
trying to learn C, though. Thanks for your suggestions, though.

No, it's not PD. Maxon (a PD distributor in Germany) has got a license to sell
RCS 1.4 for 10 DM. So it's only almost PD. But I'd like, that someone at Atari
would correct me and say, that you can get RCS 2.X for free. :-)

3267. ST MIDI ports

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-21 08:17:47 UTC
From: cczcole@unicorn.nott.ac.uk
Message-ID: <1991Aug21.081747.4849@cs.nott.ac.uk>
Source record: 47256

Hello,
Last night I was reading an article in the magazine "Sound on Sound"
(otherwise good UK 'hi-tech music' magazine) that was talking about the
use of computers with MIDI equipment. Essentially it was a report on
MACs, but included a throwaway one-liner when comparing STs that read
something like, "Leaving aside the fact that the STs MIDI ports are
wired incorrectly....."
This was news to me, as I'd had no trouble with my small dabblings
in the matter.
So, does anyone know whether there's anything in this statement,
and if so, does one need to rewire the MIDI ports, and again, if so,
what should be done?

Thanks,
Marlon

Source record: 47260

As I remember (and I'm sure someone will flame me if I am wrong:-), MIDI uses pins 2, 3 and 4 for signal and ground. By the spec, pins 1 and 5 should be left alone, unsoldered, unused. In the Atari ST series, however, those pins perform MIDI thru, i.e. the input signal is passed, after opto-isolating, to pins 1 and 5 with ground still placed on the proper pin (sorry, I don't have my favorite reference article on MIDI from a very old Electronic Musician mag here at work so I cannot be specific about the wiring - if you need it, let me know and I can go hunt:-).

If you use cables from, say, Radio Shack (which I do, BTW, so don't think I am in any way slamming RS - the cables work great!), you will find that they are five wire (1-1 ... 5-5) cables and can cause problems with some equipment that is not properly wired.

The advantage in this is that you could easily wire a box that connects to the MIDI out jack on the Atari ST which would give you a MIDI thru capability (however, to be strickly in-spec you would probably want to opto-isolate the signals et al).

Hope that answers the question.

They are probably referring to the fact that the MIDI through is brought
out on otherwise unused pins on the MIDI out connector rather than to
a separate connector. This is a minor "hair splitting" point anyway as
anybody doing any serious MIDI work would probably use some sort
of MIDI distribution box rather than MIDI throughs.

The ST's MIDI ports are not so much wired `wrong' as `peculiar'. And it's only the MIDI OUT one that's at all strange. Basically, those lovely people at Atari saved a few bob by incorporating MIDI THRU into the MIDI OUT socket. Now, where a normal MIDI OUT socket has connections to pins 4 and 5, there's also a THRU signal on pins 1 and 3. This doen't cause any problems whatsoever, since nothing at the other end should be listening on these pins. So, you can build a simple adpator which brings the signals on pins 1 and 3 out to your very own MIDI THRU socket. What's `wrong' about that? Like I said, just peculiar. But then that's why we all love Atari Corp... ;-)

3275. Need a fast routine that does redraws in Pascal

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-21 19:47:38 UTC
From: rcte2p@menudo.uh.edu
Message-ID: <1991Aug21.194738.20096@menudo.uh.edu>
Source record: 47263

Basically I am looking for a procedure/routine that will save a section of the screen so I can call it just BEFORE I open a dialog box, then I would paste it back after the dialog closes. Now, I do know about SAVE_SCRN() and RESTR_SCRN() but I do not NEED to save the entire screen. Actually, I am getting tight on memory, as this program has to run on all machines, from a lonely 520 with 512K to 4M+.... so I have to make sure I don't waste needed memory... and saving 32K of screen data to a buffer is a big waste to me.

Thanks...

WARNING!! it is probably still producing the write-errors, but
the asci <--> scsi adaptor on old atari sh204 had the bad habit of not
reporting back status of scsi operations. there is a replacement rom
available from berkeley microsystems for the sh204 adaptors, to
correct this problem. in the mean while i would belive what your icd
adaptor is saying to you.

cheers,

Two quick inquiries (sorry to waste news space):

If anyone from PAM Software (the German company that makes MultiGEM) reads this newsgroup, could you please leave me e-mail? I don't speak German, so an English reply if possible...

Also, to the creators of GEMINI 1.2 (or anyone really), what is the suggested Shareware donation for Gemini? I looked through the various DOCs, but could not find a mention. Whatever the donationis, what would it be in American dollars? (I don't know the exchange rate of DM, etc)...

From what I have read and seen the Kuma would be one of the Best,
Far, Far better that the Atari RSC 2.8 that I have seen,
the Kuma RSC was bundled with Mark Williams if I remember,
also anothere RSC is HiSoft WERCS

3281. file selector, screen redraw

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-22 12:29:38 UTC
From: wagg@zellweger.ch
Message-ID: <1991Aug22.122938.440@zellweger.ch>
Source record: 47271

I have a problem using the file selector. How can I get the
coordinates of the screen area overwriten by the file selector.
I do not like to hardwire the coordinates in my code (problems
with different monitors) I want to save _only_ this area and restore
it without using the screen redraw mechanism of GEM (i.e. sending a
redraw message).

Georg

The resource.prg that was bundled with MWC 3.0 doesn't bear any Kuma copyright notices, but if you load the RESOURCE.RSC file and look at the ``About...'' dialog box, you can see something interesting by activating the background near the copyright notice and selecting ``Unhide.'' Try it sometime.

I have the old Digital Research RCS 1.4 that has been recommended here, and it's not merely limited; it's badly broken. The vertical dimensions of objects are all screwed up. I wasted about $20 on Eurocheque fees -- more than the price of the program -- buying it from a German magazine publisher. Don't do it.

What if the user has an alternative file selector installed, such as
UIS or LGFS? Or if the program is emulating the TOS 1.4 fsel_exinput
function on an older machine through the GEMFAST library? You can't
know that in advance, but the redraw message mechanism will give you
the proper size. If you don't want to use it (say, for example,
you're writing a command shell that has a file selector feature), you
can always save the whole screen and restore it.

Current exchange rates are published daily in the financial section of most major U.S. newspapers. What's harder to figure out is *how* to send the money -- can you, in Germany, deposit a draft drawn on a U.S. bank, S&L or credit union in U.S. dollars? I've been meaning to send a payment to the Gemini crew, but the physical arrangements cause me to keep putting it off. (I probably should just tuck cash into a double-thickness envelope and trust the mails.)

While I'm asking Gemini-related questions ... is there any way to make Gemini NOT switch directories when running a GEM program? I'm not real happy about finding myself transported to c:\bin\ against my will.

(It's not necessary to switch to the directory where the application's resource is located -- you can put all your resources in one folder, set the PATH variable properly, and never have to see them again.)

I was basically planning on sending a Cashier's check from my bank -
I figure that should be a reasonable way to do it (it would clear
a whole lot faster than a personal check, and be safer than cash).
Anyone else have any possible options?

PAM Software has developed MutiGEM, but is not distributing it. If
you have any problem with MultiGEM, you have to write to Maxon.
I don't think, that anyone of PAM is reading this group, because
in Germany it's still hard to get into usenet as a private person.

> Also, to the creators of GEMINI 1.2 (or anyone really), what is

The fee for GEMINI is DM 50.-, that would be about US$ 30.

But don't forget to check the screen size first and save the screen using
VDI calls. There are resolutions/graphic modes with screen memory sizes
different from 32000 bytes.

I'd just put the money into an envelope (if it's not too much) and send it
via air-mail. I've done it the other way around (Germany -> US) a number
of times, and never lost the money.
Cashing foreign checks is generally quite expensive (up to 15 dollars),
changing bank notes is much cheaper.
Just don't write "Carefull, money included" on the envelope ;-)

3291. 2.5 Meg upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-23 17:07:06 UTC
From: yonder@netcom.COM
Message-ID: <1991Aug23.170706.4088@netcom.COM>
Source record: 47279

Hey, I had the brilliant idea that I could do my own memory upgrade, it seemed simple enough. I have some docs, and little fear of soldering irong... Obviously, it ain't working...yet. Here's what I did: Got a coupla one meg simms. Cut out my upper bank of 256K IC's on my 1040STf with the two rows of chips under the keyboard. Ok, I had at this point finished my memory degrade.. I was (and am) a 520.. Ok, now I hooked up my SIMMS to the address and data bus and RAS and CAS and ran the extra A9 from the MMU (thru a 33 ohm resistor). Well I got all this from a doc I had where I guy did the same thing with a coupla SIPs. Anyways, it aint working, now MAYBE I got something wired wrong, but I don't think so. (I know how to interface memory -- just not with Atari's MMU!). Anyways, The way I figure I am now is lower bank 512K and upper bank 2M. Is this cool (I have TOS 1.0). I have a program called BANK*.TOS (something with BANK in the title). This program prints out a list of the valid configs and the current config of the machine. Now it says my machine is config 4, which isn't on the list. The 512,2M config has "usually reserved" next to it! What does this mean? The SIP doc didn't say anything about it, but I have since gotten another doc where the guy uses SIMMS, and replaces the upper bank (just like me), but then he swaps CAS and RAS, do I NEED to do this? Why didn't here just replace the lower bank? Anyways, I understand about CAS and RAS and all that, I just don't understand which setup is excecptable: 512,2M or 2M,512 or maybe both or OK.. Somebody PLEASE help..... thanks...

Hello Out there in Cyberspace...

I am currently looking into converting an ATARI ST into a Macinotsh. I already have a set of MAC ROMS (64K ROMS, 128K ROMS) that I would need to plug into the atari. My question is, where can I get the blank ROM cards that go into the side the ST, and also, is there anything else special involved? I have the MAC OS already, and I already have a monitor. So that's no problem. All replies are greatly appreciated...

Thank You for your time,

Salvatore Collora

You should be able to run your SCSI I drive with a SCSI II controller.
The difference is that SCSI II allows for faster data rates (10MB/sec),
an extended command structure, and a 16 or 32 bit data path. The so-called
SCSI II controllers that are available now only provide for faster data rates,
and since each device 'negotiates' it's own speed on the bus, your SCSI I
disk will work.

3294. Laser C / MONST 2 debugging

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-23 21:17:13 UTC
From: cmedley@wam.umd.edu
Message-ID: <1991Aug23.211713.4163@wam.umd.edu>
Source record: 47280

I have Laser C v2.1, and I am using DevPac ST 2.08 to write a new version of the INIT.O code that is supplied with Laser C. I'm having no problem with my variables being used properly in both the C code and the assembler code, but when I compile it (with the option to create a GEM symbol table) and look at it with MONST2, the symbols for the variables are in totally different locations from where the actual variables are to the program. i.e., I have a variable called _app, and it is used properly by both the C and Assembler code, but in memory, when looking at it in MONST2 it appears to be way outside the program, beyond even the BSS segment, in a "free" area.

Has anyone else out there had experience with this kind of situation with MONST2? Is there some "fix" for this? (I'm beginning to think I've done something wrong, but I've tried writing the assembler code under Laser C and the same thing happens when I debug with MONST2)

3295. GEM-based ZOO shell, beta

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-24 04:07:08 UTC
From: steve@thelake.mn.org
Message-ID: <A3101955863@thelake.mn.org>
Source record: 47282

I've written a GEM-based user interface for ZOO that I'm willing to mail out to a limited number of volunteers for evaluation and recommendations. I don't have all the features that I want working just yet, but it's complete enough to be useful as well as provide an idea of the direction in which I'm going.

The program uses menu entries and the file selector to determine what you want, then builds a command line and executes ZOO.TTP.

I put it together after reading some gripes on GEnie from folks who either couldn't figure out how to use ZOO or couldn't run it from the Desktop because old TOS upcases all .TTP arguments.

After I'm reasonably satisfied with the program and have the source code polished up, I'll release both sources and binaries in the appropriate newsgroups.

> yonder@netcom.COM or clr40@amail.amdahl.com or chrisr@leland.stanford.edu

I have seen 2 articles on this and one changes the RAS/CAS of the last bank to the first, there was a physical reason, as it was easyer to place the Simms in the place of the second bank, rams where under the keyboard.

The other article used the second bank for the Sipps

What I did in my machine was to use Simm sockets and a small piece of Vero Board, this is mounted inbetween the drive and PSU.

The board has 4 sockets so that I can go to 4 megs if needed, but only the wires for the first bank are in, but that only meens 3 wires for the other bank.

I did use ribbon cable from the simm board to the main PCB, wires where kept as short as possible but would be some 6" long at least.

The power lines to the simm board are very thick,? (I don't l know the guage but they where the wires from a PC power Supply to the Drives) with 2 for + 5 volts and some 4 for the 0 volts, 2 of these are 4mm braid going to the cover screws of the disk drive..

So far no problems..

david boyce (uunet!sifvs3.SINet.SLB.COM!boyce) and myself
recently did a port of g++ version 1.39.1. it should be available on
atari.archive. it works in conjunction with gcc-1.40 its libs and
utilities, and share everything it can with gcc-1.40. it does not
depend on UNIXMODE being available. (btw: the linker was fixed to
handle set vectors correctly, instead of using weird hacks to handle
constructors etc).

Gnu smalltalk v1.1 has been ported to the ST too. It does
not include any of the traditional graphic environment of SmallTalk.

The above should both be available on atari.archive.umich.edu

commercially: ParcPlace SmallTalk-80 (i have version 2.3, but
understand that later versions are available too) is also available
from Georg Heeg. This is the real thing.

All of the above need a decently configured ST, with 4M memory needed
for any serious work.

cheers,

3299. 68K Instruction Cycles

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-25 14:37:24 UTC
From: qralph@dna.lth.se
Message-ID: <1991Aug25.143724.2018@lth.se>
Source record: 47287

According to my measurements the instruction Move.B (d8,An,Xn) executes
in 16 cycles on the ST, instead of 14 as stated by Motorola.
I guess that this is caused by the video circuits in the ST.
Is this a good guess?

On the ST all instructions are executed in 4*k cycles where k is an
integer. So your instruction doesn't take 14 but 16 cycles (I would
have prefered 12 !-)).

Huh? What in the original poster's message makes you think that there is any piracy going on? Is it not possible that these are perfectly legal Apple ROMs (such as those used in Spectres)? And as far as finder goes, am I mistaken in believing that Apple allows it to be freely copied? Maybe I'm missing something here, but if not, you are reckless and should not be so quick to make accusations of felonius behaviour.

Regarding the origiginal poster's request for info about a "blank rom card:" Yes, there is a 128K block in the ST's address space which is mapped to the cartridge port, but plopping the Mac ROMs into it certainly isn't going to turn your ST into a Mac. Perhaps you are referring to Gadgets By Small's Spectre GCR which plugs into the ROM port and does turn an ST into a MAC. This is available for a few (couple?) hundred dollars.

Jim

This is Blatant Stupidity and you should be Removed From the Net..

What makes you think that he is copying anything??? He just said that he wanted an empty ROM cartridge for the ST to hold the (supposedly) legal ROMS that he already has. Granted, Apple does not like this, but they have no legal recourse since the only copyrighted material is the ROMS and the OS software, which he has legit versions of.

He might have a problem with his approach though. It took Dave Small of Gadgets by Small a few years to get the 64K ROM version of his package to work with any reasonable success. His new package that handles 128K ROMS really sparkles and can be had for around $250 (US). For that price, I'd skip the hacking...

Before a big controversy brews again over this net, allow me
to put a little input into it (ensuring a controversy, eh? :-)
Onreading his message, I don't think he is attempting to pirate
at all. I think what he means by "blank ROM card" is the actual
SPECTRE cartridge,as he ALREADY has the MAC ROMS.

Of course, this is just from my reading of the message; and
obviously there are at least 2 readings of the message, so maybe
he should clarify himself.

Anyways, if his meaning is meant by my interpretation, then I'll
give him an answer. What he needs is a SPECTRE GCR cartridge
which is made by "Gadgets by Small." He can purchase one from
a number of mail-order places. He could then just take his
MAC ROMS, pop them into the cartridge, plug it in, load up the
included software, and away he goes...

I just jumped in because if he did not intend to pirate, then why scare away another user? Oh well, how do I get into these things anyways? :-)

Yes, this IS the best way.

>While I'm asking Gemini-related questions ... is there any way to make
>Gemini NOT switch directories when running a GEM program? I'm not real
>happy about finding myself transported to c:\bin\ against my will.

Most GEM programs need this (to be able to find thier RSC files). You
can switch this off with an environment variable. Example: program STEVE.APP
doesn't need this directory changing:

setenv STEVE_APP=D:N

>(It's not necessary to switch to the directory where the application's
>resource is located -- you can put all your resources in one folder, set
>the PATH variable properly, and never have to see them again.)
>
>----
You're right, but I keep forgetting to copy the RSC files if they are in
another directory. This is why the behaviour in Gemini can be selected.

Well I have apologised for this in the st section, but why has
everyone gone and cross posted this to st.tech.??

Note: I only replied to one article in comp.sys.atari.st
so why the cross posting, are some of you just trying to
stir things up..??

Really? Is the Spectre GCR/128 also then blatant piracy? How about PCDITTO? For that matter, what about all the PC clones? The NewTek roms? If someone buys the Mac roms and wants to play around making a Mac-emulator at home, then more power to them. As for having the Mac OS, what makes you think this person did not just go out and purchase System 6.0.x or 7.0? That's what you have to do with the Spectre GCR, and it is not piracy.

It is? Please explain.. I don't see anything that indicates piracy directly... having a set of Mac ROMs is legal, so is having a copy of the Mac OS if correct procedure is followed (IE you obtained it in a legal manner). I see nothing more than someone perhaps trying to reverse engineer Magic Sac which is impressive if successful...

The posting is not clear, and it's pretty clear that this is
because the guy who posted it doesn't really know what he's doing.
But I agree that it sounds to me that what he wants to do is perfectly
legal. He doesn't want to burn copies of the ROMs, he wants to stick
them in a ROM Cartridge under the mistaken assumption that this will
turn it into a Mac. As you point out, Spectre GCR (or the older
cartridge port adapters) are much more than just ROM cartridges
in the sense he seems to be thinking of them.

3315. ST RESET PROBLEM

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-27 13:40:27 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Aug27.134027.19517@magnus.acs.ohio-state.edu>
Source record: 47153
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to thank everyone who responded to my last posting about my Megas random reset problems. I managed to add an -additional- internal fan (this was an extremely interesting task, if anyone is interested in how I did it, let me know and I will post the procedure). This did not help the reset problem, but it does send a lot more hot air out the back vent. (My stock fan blows out the rear, I understand some go the other way around, or maybe Atari just got confused and installed some backwards). It also seems to keep the reset/crash problem from occuring as soon, I can now stay on for nearly an hour before it starts to crash, even though I'm running the fan off the original internal power supply. I've ordered the heavy duty power supply from BEST electronics, and I'm sure I'll let everyone know if it does not do the job...

...As for my experiences with the ISAC board, it looks beautiful, and in really nice for DTP work, but there are many software problems, the most common of which is software checking for LOW resolution. The ISAC card in color mode (it also has monochrome) looks like a really huge low-rez screen to the software. So, software that should run just fine on this monitor will give the "will not run in low rez" alert, rats. This $599 card ended up costing me damn close to $1100!, I figured out that for that cost I could have sold off all my old equipment, purchased an old Amiga 1000 (which was as the local store) for $199, sent in the owners-manual cover, and gotten a really nice Amiga 3000 with AMAX and the ST emulators (I understand the *great-trade-up* in now over). Needless to say I'm a little bit upset. Oh well, I still like my old Mega (2+2), so I guess I'll keep it for a while longer...

3316. Replacing ST225 ST drive with a larger one

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-27 15:22:31 UTC
From: mpj@sequoia.cray.com
Message-ID: <1991Aug27.102231.29524@hemlock.cray.com>
Source record: 47154

Hi there,

My ST hard disk (SH204?) recently gave up the ghost.
I have ordered a replacement drive for the Seagate ST225 20MB drive
that was in the Atari HD box.
The new drive is a 42MB Seagate drive (ST251-1 I think) which has
the same MFM interface, so it should be hardware compatible..

However, I believe I need to change the (driver?) software on the
ST in order for the machine to be able to use the extra disk space.

Has anyone done this, or does anyone know where I can get hold of
the necessary software to make the 42MB drive usable ?

Thanks very much for any help,

Marvin.

3317. Injured Mega ST4

Newsgroup: comp.sys.atari.st.tech

From: avp@garfield.cs.mun.ca
Message-ID: <1991Aug27.172403.4240@garfield.cs.mun.ca>
Source record: 47155

My Mega ST4 no longer will drive the printer (HP Deskjet) or
the monochrome monitor. It will work fine on the colour
monitor. The printer works both an a Mega STe and a 1040ST.

I was wondering if these problems might be as simple as replacing
a chip or two. Any insights or ideas would be greatly
appreciated.

thanks

It sounds like your MFP has died. That`s the 68901 Chip that is
responsible for handling all sorts of interrupt sources (in your
case the "Monochrome Detect" and "Printer Busy" lines).
But then again: I may stand corrected...

3320. SCSI Harddisks

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-28 11:09:56 UTC
From: mami@opal.cs.tu-berlin.de
Message-ID: <4720@beauvoir.cs.tu-berlin.de>
Source record: 47159

I hope to find some help for my decision which harddisk I should buy.

I own a STe and want to buy a HD with about 80 MB.
Now I saw that SCSI HD are much cheaper then the HD that are produced
for the ATARI.

My questions:

1) Does anybody has experiences in connecting a SCSI HD
to a STe ?

2) What advantages and disadvantages are there ?

3) Does anybody knows documents concerning this subject ?

Thanks for your help,

Manfred.

3321. Program wanted to define keyboard macros

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-28 12:19:47 UTC
From: mami@opal.cs.tu-berlin.de
Message-ID: <4722@beauvoir.cs.tu-berlin.de>
Source record: 47160

Most programs that run under GEM have a mainloop waiting for the termination
of an evnt_multi call and reacting different for different events.

There exist programs that have keyboard shortcuts for the menu items so that the
advanced user may save some time.

Now my idea is to write an accessory that lets the user define his/her own
keyboard macros not only for the selection of a menu-item but also for other events
like mouse-clicking. The accessory has to interfere in the evnt_multi system call
and modify the results.

Now as I don't know to much of the TOS and GEM details my questions are:

1) Does anybody know such a program (where can I get it) ?

2) Are there fundamental problems about my idea ?

3) Is anyone interested in such a tool ?

Thanks for your replys,

Manfred.

3322. Re: Official weird thing: wandering menu bar

bboychuk@sdcc13.ucsd.edu (The Majestic Llama) writes:

|In a program I'm working on, after a re-compile, the menu bar [...]
|is now showing up about three text lines down and half a dozen
|spaces over from the left.

This is probably due to a bug in the Atari RCS. The things that seem to trigger this bug are moving menu items around followed by quitting the RCS and then saving the resource from the exit alert box, rather than saving first, then quitting. Another thing that might cause this is trying to edit a "menu" type tree as a dialog or a panel.

This used to happen to me occasionally when I would edit menus, until I got into the habit of always explicitly saving the resource before exiting the RCS.

To make your resource usable again, read it into a binary file editor. Look at the second word in the resource file; that is the offset to the object data. Go to that offset in the file (you'll probably see that the strings in your resource come before the objects), and find the root of your menu tree. If your menu tree is the first tree in the resource, you'll be patching the first object. If you found the menu tree, the bytes at that location will look like:

```
FF FF 00 01 00 0x 00 19 00 00 00 00 00 00 00 00
^^^^^ ^^^^^ ^^^^^ ^^^^^ ^^^^^ ^^^^^ ^^^^^^^^^^^
next head tail type flags state spec
```

ob_tail will equal the number of titles in your menu, and the ob_type of a menu ROOT object is always G_IBOX (25, or 0x19).

Following those 16 bytes is the rectangle of the IBOX which is the root of your menu. The first four bytes of that rectangle (the ob_x and ob_y) should be 0. In your resource they aren't, because the RCS corrupted them, which is why your menu is showing up in the middle of the screen. Set those 4 bytes (the ob_x and ob_y) to 0 and save the file back out.

If you have Allan Pratt's DB (Release 3), you can use the following commands to accomplish the above:

```
:read foo.rsc
Done, start=<rwstart>, size=<rwsize>
:`t0 = `rwstart + wpeek(`rwstart + 2)
:dw `t0[14]
<addr>: FFFF 0001 000x 0019 0000 0000 0000 0000
<addr>: junk junk
:sl`t0+10 0
```

```
:write foo.rsc
Overwrite existing file foo.rsc? y
Wrote foo.rsc, start=<rwstart>, size=<rwsize>
```

The next time you run your program, the menu bar should show up in the usual place. Remember... you shouldn't have this problem if you always remember to save the resource file out before quitting the RCS, and never change the type of a MENU tree to dialog or panel.

I had this happen to me, and people here said it was a problem in the resource file, introduced by some versions of RCS (Atari's Resource Construction Set). Unfortunately, once this happens to your resource file you can't un-do it. I'm told it comes from saving the resource from the "Abandon / Save / Cancel" box that comes up when you select "Quit" or "Close" from the top level after you've changed the resource. It doesn't happen if you always save using the "Save" menu item, then use "Quit" or "Close" to get out.

Like I said, once it's happened to your resource file it won't un-happen unless you actually edit the file on disk. Since I don't know exactly what happened or what resource files and menu bars look like, I can't help you there. Go back to a backup version of your resource file. (What? You don't keep old versions of important files under development in case stuff like this happens? Sorry!)

DISCLAIMER: I have had this happen to me and I've told you what the people here told me. I do not know what version(s) of RCS this affects, I don't know whether or not it's been fixed, and I don't know whether or not it will be. Not my department. I'm trying to be helpful here.

I seem to have half-solved my problem. By forcing the X,Y of the
GEM object to 0,0, the menu bar now appears in the right place --
but I still have no idea why it's coming in from the .RSC file with
goofy coordinates... Apparently, the resource is screwed up and
I'm afraid that this is just a small part of a larger problem that's
going to jump out later and eat me. Anybody know how to correct
this?
(Warwick: I tried to reply to your E-mail, but it bounced.
Thanks for your suggestion about the screen memory being offset, but
everything else (plines, dialogs) all draw correctly. The problem
appears to be in the resource file...)

Don't buy Supra HardDrives. Supra has stated that they
will not support STE any more. Most of there drive interfaces
have problems with the STE, Some of the Atari Drive will work.

The primary problem is the Atari ScSi interface. The two
intefaces system that I feel will work are the BSD inteface
and the ICD inteface. The ICD interface is prefered as they
will set the bits that allow the STE to boot from the HARD
disk, where as there exists shareware for other diskdrives
to boot from a floppy and then reboot the HardDrive.

Hello! I've recently been trying to stuff some information from a Gem program I've been working on into a dialog. I would like to place some numbers that the program generates into a detailed dialog which I am putting together with the MWC rcs. The MWC docs otherwise describe creating a dialog in great detail, but seem to assume that the program calling the dialog should not want to update strings or text fields within it. Is it possible to change such a string or text field before calling the dialog? (I'm currently working under GNU C, if it makes a difference.)

Thanks Much

That shouldn't be a problem, since I've seen many examples of programs
which do just that. I've also done a little GEM programming myself
(also using GNU C) and I think all you have to do is monkey with the
TEDINFO and perhaps the OBJECT structure a bit (or two :-). This
would involve changing the text string (forgot what it is called) and
the ob_width, ob_height fields of the respective structures. You may
also need to call form_center() after each change, but you'd probably
do that anyway.

3330. Mega STE & MC68882 Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-29 06:43:51 UTC
From: goenning@hpbbi4.BBN.HP.COM
Message-ID: <7120007@hpbbi4.BBN.HP.COM>
Source record: 47178

Hello Netters and Atari Cracks !

This is a cal for help concerning

MEGA STE/4 & MC68882 Coprocessor .

I've bought a new MEGA STE on the "Atari Messe" in Duesseldorf,Germany.
Right after arriving at home, I tried to install a MC68882 math coprocessor
in the empty socket. The Atari does things fine, except recognizing that
there's a coprocessor installed. Turbo C 2.0 allows to comile code
for a MC68881/2. The resulting code crashes with 11 bombs a the first
fpu instruction (a fmove to initialize fpu registers).

So here the obvious question :

What do I have to do to tell the Atari STE what a wonderful
coprocessor is installed ?

BTW, I have 3 other MC68882 chips laying around here. Do you need one ?
(MC68882 / 33 Mc) You'll get them with info for correct installation
as soon as I have fix the problem. Just make a offer.

OK. Any help would greatly appreciated.

Thanks to everyone reading this note.

Bye,
Frank

You can buy the Cleanup separately and I think it is a very good
program. The hard disk utilities can be downloaded from the ICD BBS,
BUT they need an ICD host adapter to work...

Sure. There are two ways to approach this, though. You might create the
object as a string, or you might create it as a TEDINFO (editable text).

The former is easy to manipulate -- the ob_spec field is simply a pointer,
so you can assign it a new value or copy into the pointed-to space with
strcpy, sprintf, et cetera (be sure it's big enough).

The latter is a little bit on the ugly side, but it makes sense once you
look at it for awhile:

```
((TEDINFO *)tree1[DISPLAY].ob_spec)->te_ptext= "This is the Display";
((TEDINFO *)tree1[LINE1].ob_spec)->te_ptext= "Input text here. LINE1";
((TEDINFO *)tree1[LINE2].ob_spec)->te_ptext= "More text here. LINE2";
```

Have to disagree with Kermit Tensmeyer a little bit. The BMS (BSD?, what BSD? 8-) adaptor works well with my STe. It can auto boot with the HDX 3.01 atari driver software that it comes with, and so far, I have had no problems (autobooting) with the Supra Utils that I bought from Supra tech support ($25) on it either. (Note: I am using Supra software *only* and the hardware is still the Berkley Microsystems Host Adaptor).
If you are as unfortunate as I, and have a Seagate 296N (cheap, funky and loud) for your 80Meg Drive, the BMS HA is the only way to go. The BMS board runs it at 1 to 1 interleave, ICD doesn't. The result is 682K bytes/sec throughput instead of 430K bytes or so. The BMS software and documentation is not too great, luckily they are good at tech support. Why am I running the Supra software if the Atari HDX works fine? Because I want to use 32Meg partitions with

512 byte sectors - for reasons of compatibility, this is impossible
with the Atari driver (it uses larger logical sectors above 16 Meg).

I have a question too, 8-):

Speaking of ICD, is it true that they are now selling some/all
of their Host Adaptor software by itself? I have what I need, but
remember the old ICD stuff (including CleanUp) fondly, especially the
error checking, which can't be had elsewhere.

Here's a small start. Additions are welcomed.

DO:

-- Use a special startup module if you're using a C compiler.

-- Call appl_init(), then menu_register(). The latter call will
give you the index of your menu entry.

-- Go to sleep until you get an AC_OPEN message indicating that
your menu entry has been selected. Be sure to check msg_buf[4]
against your menu entry index.

DON'T:

-- Dynamically allocate memory (malloc, strdup, etc.)

-- Use a C library stream i/o function. Use GEMdos directly instead.

-- Leave a file open and call an AES function (you may lose big if
the foreground process terminates, because the file will be closed).

-- Terminate.

Since I don't have access to comp.sys.atari.st could someone post this
over there for me...unless you can answer the following question.

I'm using 1st Word and I would like to print the TM and [R] symbols
but am unable to do so. The printer I have is EPSON compatible and the
printer driver I use has these lines in it...
BE * No Registered symbol
BF * No Trademark symbol
Now if I put a '*' infront of the BE & BF I should get what I want.
But that doesn't do the trick. So is the problem with the 'dip
switches' in the printer? I've tried changing them but to no avail.
Any help would be appreciated.

From: george@electro.com
Message-ID: <1991Aug30.125425.2356@electro.com>
Source record: 47179

I recently replaced the two ls373 latches on my ST with
sockets and inserted 's' versions of the same part.

Now the machine no longer boots. Instead, I get what looks
like a memory test on the color screen and then nothing,
a black screen with white border.

I've triple checked the sockets, ohmed for continuity and
shorts. All in all appears to be a *very* clean operation
but....

Any ideas on what's gone wrong?

Any help would be greatly appreaciated.

D.M.Johnson@newcastle.ac.uk (Dave Johnson) writes:
> Now that I have got TOS 1.4 ...

You should get CACHExxx.PRG and put it in your AUTO folder, and rename it so XXX is about 040. This will speed up disk stuff A LOT -- more than it's already sped up by TOS 1.4 without CACHE.

You should get PRGFLAGS and set the fast-load bit of all your programs except Microsoft Write and some parts of GCC. Does anybody know of other programs that don't run correctly when the fast-load bit is set?

(Run this comparison: see how long it takes from the time you see the hard disk driver's version message and the time you see the Desktop. Then set the fast-load bits of the programs in your AUTO folder and reboot. It should FLY by comparison.)

You should NOT do away with FOLDRxxx.PRG. TOS 1.4 still takes advantage of the extra memory.

You should get POOLFIX3.PRG ... Yes, there's a bug in TOS 1.4 which this fixes.

Hmm... Can't think of anything else off the top of my head.

No, not really. If you have the current Supra formatter and their
host adaptor (meaning from ACSI to SCSI - not directly to MFM) you can
hook up a Syquest or a Bernoulli removeable drive with no problem.
Heck, on a TT you don't even need the HA. Current Syquests come in 44
or 80 Meg size, and Bernoulli drives have comparable capacities. For
the smaller size removeables, the prices are in the $400 - $500 range
for a drive with a single disk.

3345. MWC malloc and memory upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-30 23:13:06 UTC
From: jmw@probitas.cs.utas.edu.au
Message-ID: <jmw.683593986@probitas>
Source record: 47180

Having recently upgraded my 1040STFm to 2.5 Mb, I looked forward to being able to use the larger amount of memory in programs written with MWC 3.0.5. However the malloc routines give up well before all the memory is used up.

For example, with a 500k ram disk, caching, and a few accs loaded, mf says there are 1700000 bytes free (approx values). A simple program which mallocs repeatedly, without freeing any memory, until malloc returns NULL, gives up after less than 600000 bytes have been malloced. This figure is only marginally affected by the amount of memory malloced at each call.

Similarly me, the MWC Micro-Emacs editor will not read in files beyond about 350K. This is also due to the malloc routines returning NULL.

A number of programs are available to indicate how much memory exists, and they all confirm the presence of 2.5 Mb. Also other programs which apparently don't use MWC's malloc seem to be able to use the extra memory.

My conclusion is that there is a problem with malloc in the MWC libraries. Can anyone shed any light on this? I am not encouraged by what I have read about Malloc, the TOS equivalent. Are there any other alternatives?

While I'm on the subject, lrealloc from the same library has never properly worked - it causes a crash more often than it works, but I can live with that.

Source record: 47182

Having had my reply bounced, allow me to post a follow up to this question.

74S373 requires far greater power supply than a 74LS373, which is obviously the reason for an unsuccessful hardware hacking. Why not replace a 74LS373? Or you could almost always replace an LS type with the ALS one. I wouldn't add a 0.01 microFarad capacitor to the 74S373.

Generally speaking, Atari's are not designed to be used seriously and their main effort has been oriented towards reducing the manufacturing cost (this applies to their competitors as well, including IBM, Apple,Commodore, and Sun). This is easily understood by a simple look at the capacitors and resistors used. The big aluminum electrolyte capacitors used are the cheapest ones and may not last for more than two years. Check the voltage of the mother board and if the voltage is below 4.70, the ST won't run reliably. If it is below 5.00, I would buy the latest capacitors and install them (particularly the big ones on the power supply module). Good capacitors last for five years.
As for the resistors, the big and expensive ones such as used in the CRT need to be checked (don't do this yourself though, or you will be killed).

ytsuji

P.S.
Eric Stuyvesant has reported to me that his 1.44 MB floppy drive adaptor has been working flawlessly. I have asked him to pass the sample module I lent him to his folks in the States.

3347. How do I disable Control-C?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-31 08:44:16 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <HscJ82w164w@ersys.edmonton.ab.ca>
Source record: 47184

Hello. I have been learning the C programming language for about four weeks now, using C Primer Plus. I wanted to learn because I could make faster, more efficient code with C. Unfortunately, one problem is still dogging me.

In all of my programs that use text output functions, pressing control-C during an output causes the entire program to terminate. THIS IS ANNOYING! How do I prevent this from happening? The functions I use are:

```
getchar()
putc(character, file)
getc(file)
```

These are the only three I used for input and output.

Quote Of The Day: "If I had a gun..." <Grin!>

Note: The routine is part of a larger program, so exiting the entire thing is definitely not a good idea. Interlink and Flash manage do do it, along with a host of other programs that aren't completely dialogs and windows... If anyone could help, I would really appreciate it.

3348. Disassembler for Mark Williams object modules

Newsgroup: comp.sys.atari.st.tech
Date: 1991-08-31 15:39:18 UTC
From: steve@thelake.mn.org
Message-ID: <A1424561951@thelake.mn.org>

I'm looking for a program that will disassemble .o modules produced by the Mark Williams C compiler. I'd prefer that it produced standard Motorola asm, but MW's asm is acceptable (I can always translate by hand). Is there such a beast?

I thought DISTOMWC might do the trick, but it won't -- it works only with DRI-format objects.

Basically what I'm faced with is this: I have a library of high-level windowing functions that I want to use with Sozobon C, but it's available only in MWC format. I want to convert it. Source code is not available, so I have to go the harder route.

3351. 2.5 MEG EXPANSSION & ADDING BLITTER TO 1040STFM.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-01 01:19:03 UTC
From: t821431@minyos.xx.rmit.oz.au
Message-ID: <1991Sep1.011903.19642@minyos.xx.rmit.oz.au>
Source record: 46993

I would like to know if the 2.5 Meg memory expansion will work on my 1040stfm.

I refer to the one which was recently posted on ftp 141.211.164.8 by
C. Hicks titled adding 2.5 MEG to your 1040 st.
His atari board no. C070789-001 REV D HAD 32 rams on it as standard!

My atari has motherboard serial no. C103414-001 REV 1.1 GX-211 VO 0789.
and has only 8 ram chips. The are 42456-12 rams. being u3,u4,u5,u6,u10,u11,u12,
and u13.

Will this modification work on my machine or what other details do i need to consider if i am to attempt this mod?.

BLITTER

My atari also has a blank spot on its board for a blitter chip.

Can i add this chip and will it then work with blitter or is there other mods
required
Note My atari 1040 stfm has tos 1.2 installed.

Many thanks in advance from Richard Clarkson

>putc(character, file)
>getc(file)
>
All of these are C library functions, so you'll have to check the documentation for your C library to see how to turn off control-C checking. With the standard or MiNT gcc libraries, you can use the ioctl function to do this:

```
#include <stdio.h>
#include <ioctl.h>

struct sgttyb old, new;

void ctrlc_off(f) FILE *f; {
ioctl(fileno(f), TIOCGETP, &old);
new = old;
new->sg_flags |= RAW;
ioctl(fileno(f), TIOCSETP, &new);
}

void ctrlc_on(f) FILE *f; {
ioctl(fileno(f), TIOCSETP, &old);
}
```

Call ctrlc_off() first; call ctrlc_on() later to put the terminal back in "cooked" mode.

Note that the above code has some side effects: getc() and getchar() will return immediately (as soon as a character is typed) instead of waiting for a whole line to be typed, so you may want to check for backspace and delete in your code and do the appropriate things.

If portability is not a concern, you can use the ST operating system function Crawio() to do the I/O instead of using getc() and putc(); this might be a simpler solution (and is library independent).

>-> now what did I find a controller that controlls Seagate -N type drives...
>and isn't this ST-N type same as plain SCSI-drive ???
Yes, ST-XXXXN are Seagate's SCSI hard disks...

>NOW the question is... could I get a removable SCSI hard disk drive and hook it
>to my old ST with that supra-controller (that makes it look like mfm ?)
Huh? What do you mean with "that makes it look like mfm?" If scsi-drive
was connected to that controller, why for gods sake should the controller
make it look like mfm???
If an SCSI drive was connected to that controller (i.e. if there is only
50-line cable between controller and drive), you can connect any SCSI
drive. If there are two smaller cables (approx. 20 lines each), then it's
an MFM or RLL drive and you won't be able to connect an SCSI drive...

>and last but not least... if yes, are there SCSI removable hard disks around ?
>-and what in a world do they cost ???
Of course there are removable SCSI drives around. Syquest's SQ555 is most
known one. It was build into Atari's Megafile 44.

> You should get PRGFLAGS and set the fast-load bit of all your programs
> except Microsoft Write and some parts of GCC. Does anybody know of other
> programs that don't run correctly when the fast-load bit is set?

The first ACC to load can't have the fast-load bit set. Otherwise you
get wierd results afterwards. (The guy who wrote the VDI replacement NVDI
found this one out.)

Also some compiled GFA 2.x programs (like the mercury UUCICO <sigh>)
sometimes behave strange.

> Hello! I've recently been trying to stuff some information from a Gem
> program I've been working on into a dialog. I would like to place some

just stuff the new string into the te_ptext text field (assuming it
was created with string space), or change the text pointer: for example
(this is from fast.prg written by yours tuely)

```
void stuff_string(OBJECT *tree, char *format, int obj, double value)
{
TEDINFO *t;
if(obj == NIL)
return;
t = (TEDINFO *) tree[obj].ob_spec;
sprintf(t->te_ptext, format, value);
t->te_txtlen = (short)strlen(t->te_ptext);
}
```

> dialog? (I'm currently working under GNU C, if it makes a difference.)

the only difference GNU C makes is that if a dialog's strings are
compiled into the program (for instance by including the resource's C
image) then the -fwritable-strings compiler switch must be used,
otherwise gcc will share identical strings and when you stuff the
new string, you will end up changing other strings in that or other
dialogs that you did'nt intend to.

cheers,

Usually, these functions use GEMDOS calls to do their work; the GEMDOS is the
thing that stops your program when pressing crtl-c, when you use the BIOS
functions, this will end.

We were in Germany for the Atari Messe show and were unable to upload our POWs
for the last three weeks of August. I have just sent them to terminator and
to the binaries newsgroup. The programs are:

DC Mouse-ometer will let you know how far your mouse has travelled
during your hard-at-work or just-having-sessions on the computer.
Suggested by a friend of a "Mac user with this neat little mouse
gadget."

DC Run Rez automagically switches screen resolution for files that don't
do so on their own.

Just say no to "Please switch to ???? resolution" alerts!

DC Light Off will turn off your floppy disk drive (and light) after you
have booted up. Useful when you boot up without a floppy disk inserted in
the drive. Suggested by Larry Novak.

All programs 100% assembly, ST, STe and TT compatible. Program of the week.

I am trying to find out something for a friend of mine...

Please also note that I know very little about the Atari machines

technically speaking.

My friend has a 520 ST and would like to beable to run some software

that is capable of seni-complex text and graphic designs. He is a

an evangelist at the church where I go and makes overheads and other

types of hand outs for classes. Presently he has the opportunity to

buy a used copy of Calamus. This appears to do what he will need it

to do, BUT he says it will only work on a machine with 1MB of memory.

He has also mentioned something about needing a double sided floppy

drive and from what he has said the 1040 ST has that built in.

My questions are:

1. Can he find a software package at a reasonable price that can do what

Calamus can do and work on his present 520 ST and hard drive?

2. If not, is it better to upgrade memory in his 520 ST and buy an

external DS floppy OR find a used 1040 ST?

3. If upgrading his present machine is a good option, where can he

find a DS floppy at a good price and where do we find specific

information on how to upgrade his memory(I know it's a piece of pie

on a IBM PC, but I know nothing about doing that to a 520 ST).

Thank You for any information or advice...feel free to suggest something

I might have over looked!

Source record: 46995

I have replaced the 256K SIMMs in my 1040 STE with 4 1 Meg SIMMs.
Two of them are with 8 small chips on them and the other 2 are with
9 small chips on them. I don't know about the access speed of the
8-SIMMs but the 9-SIMMS has a 100ns access time.

I thought this work fine at first but until recently I found out that
some programs which I copied into a RAMDISK (created using RAMPLUS)
doesn't work after I ran and quitted a few times (I got the message
TOS error 35). I try to use other ramdisk like Eternal but
they don't work at all (2 bombs).

Can anybody tell me if this is because I am using SIMMs with different
speed or different type together?

Thanks in advance. Please e-mail me.

Cross-posted to: comp.periphs.scsi,comp.sys.atari.st.tech

Hi,

I'm about to write a scsi driver for the ncr 5380. (the SCSI chip in the
Atari TT).
Now I'm told that this is a nasty beast, so I would like to ask if
anyone has a code sample which I can use to model my own driver to.
I do have the ncr doc, but often an example provides more explanation
than the documentation.

By the way: does anyone know the scsi address of the TT, or is this
software programmable. According to some TT doc, the internal hard disk
is at scsi address 0.
I would expect that the TT is programmed for scsi address 7, but I prefer
to be sure...

Thanks,

Hi,

Someone gave me an exabyte 8200, which I want to connect to my computer.
(an atari TT running minix)
Unfortunately the exabyte is from a Xerox system, and the label on the
exabyte reads amongh others:
MXPROM XERX2527
This seems to imply that I have some form of non-standard prom.
Is there perhaps some netter who knows the difference between this rom
and the "standard" one. (or does someone know an inexpensive way to get
a standard rom. The local distributer charges something like $ 150,--
which is a little steep for a simple prom, I think).

I'm also interested in the data format that is usually used on
exabyte's. Particularly I want to be able to exchange data with the
exabyte at the sun at work. Anyone any idea or pointer?

Furthermore the exabyte came without any docs. Are there any specific
scsi commands that I need, apart from the normal scsi commands for
tape-like devices?
Also: Should it be possible to open/close the drive if it is not
connected to a scsi bus, or does it require some software to release the
tape.

Thanks,

You need the MegaTalk interface (by Gadgets, needs megabus) and one of the
MIDI-interfaces for Mac to use MIDI with Spectre.

I kind of remember that Dave has once told that it is almost impossible to
use the MIDI-interface of Atari under Spectre without losing any other
qualities that Spectre already has...

Was it the Mac serial or SCSI, that conects to the MIDI-interface???
In either way, maybe it is possible to connect one using the serial port of
atari (or maybe not, max 19200 bps...) or the host-adapter for SCSI-harddisk.

From: tensmekl@infonode.ingr.com
Message-ID: <1991Sep3.163020.18222@infonode.ingr.com>
Source record: 47004

While I have been attempting to Port an "UNNAMED" program to
the ST. I ran into several preliminary problems.

1) With MWC there is a compile option to allow nested comments
This doesn't seemed to be recognised by the run time
compiler.
Make the porting the existing code a bit of a problem.
Is there a work around?

2) It would be nice to group the pre-compiler instructions

ie. #if defined(MSDOS) || defined (TOS)
rather than
#ifndef MSDOS
#ifdef TOS etc

Yes I have looked at the code for Nethack, and Micro Emacs
Any other suggestions would be accepted as well.

> 1) With MWC there is a compile option to allow nested comments
> This doesn't seemed to be recognised by the run time
> compiler.
> Make the porting the existing code a bit of a problem.
> Is there a work around?

The right way to do it is to convert the source code to legal C, which does not allow nested comments. To temporarily hide a block of source code, use the #if 0/#endif convention.

MWC claims to support nested comments with the variant option -VCNEST. If it doesn't work, I don't know what recourse you have, since MWC seems to have become orphan software.

You could easily write your own program to preprocess the source code and strip commented material, including nested comments. Increment a counter variable when you see "/*" and decrement the variable when you see "*/" && (counter !=0). When counter == 0, copy the data to the output.

If you want to get fancy, you could make nested-comment support a command-line option. For that matter, you could also support C++ comments, which are (unfortunately) showing up in some C code.

Hey, I'm almost tempted to write it myself. :-)

> 2) It would be nice to group the pre-compiler instructions
>
> ie. #if defined(MSDOS) || defined (TOS)
> rather than
> #ifndef MSDOS
> #ifdef TOS etc

The ``defined'' preprocessor command is an extension to the original C language; it is not described in Appendix A of Kernighan & Ritchie's ``The C Programming Language'' first edition, on which MWC was based.

But it is supported by all ANSI and several non-ANSI compilers. I just tested the following code with the free compiler Sozobon C 1.62i (beta) and found that it worked just fine:

```
#if defined (SOZOBON) || (MSDOS)
#include <stdio.h>
#endif
main()
```

```
{
#if defined (SOZOBON) || (MSDOS)
printf("Hello, world!\n");
#else
#error "Preprocessor does not support #if defined construct"
#endif
}
```

I don't remember whether previous versions of Sozobon supported the
``defined'' directive. The new version will be available Real Soon Now.

>there's a coprocessor installed. Turbo C 2.0 allows to comile code
>for a MC68881/2. The resulting code crashes with 11 bombs a the first
>fpu instruction (a fmove to initialize fpu registers).

The 68882 in a Mega STe is not a coprocessor, it's a peripheral. The 68000
can not use a 68882 as a coprocessor. What this means is that instructions
like FMOVE won't work. To use the 68882 in a Mega STe you need a compiler
or a library which knows about it. Check your compiler's documentation.
Look for "SFP004" in the index -- SFP004 is the name of the Atari board
that lets you put a 68882 in a Mega ST. The 68882 that's in a Mega STe
works the same way, at the same addresses.

You can prove to yourself that TOS has detected the 68882 by checking the
_FPU cookie: if its value is $00010000 then TOS saw the '882.

3370. Hard Disk Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-04 03:46:38 UTC
From: ac365@cleveland.Freenet.Edu
Message-ID: <1991Sep4.034638.10869@usenet.ins.cwru.edu>
Source record: 47008

As some of you might recall, I was having some trival problems with my Toadfile 44(syquest555 with ICD board). Well, thanks to a couple of suggestions by you I was able to keep my system going without any serious catastrophes. I spent the summer woking at a research facility and I brought my computer with me. I have to admit, not a single HD problem for two months, except for one bad sector which was mapped out the first day. Well, now my computer is here with me at Penn, and I am noticing lots of large problems with the system. Lets see what we all can come up with once I tell you what its doing.....

Just to refresh, I'm running a 44 megabyte removable media harddrive with my Mega 4ST and a helpful application called DC Desktop in the Auto folder. Everything was going good for the first couple of days, and then little bombs appeared on the screen when it would do the startup routine loading the DC desktop programs. I erased the troublesome files and reinstalled them from the original floppy. Well, the bombs still appeared, yet in different places. I worke don this for some amount of time and life was not getting any bette. I made an emergency backup of the key stuff on my C drive and copied a few graphic files to the D: partition.

Life still didn't get any better as I worked with the system. I decided that it was time to zero the partition and reintall from scratch. It now booted nicely once I put the boot files back in. But everything that I tried to restore just wouldn't run. Flash and Wwriter which were reinstalled from the original source disks would bomb upon loading.

I called ICD today and talked to a helpful technician who took me through some other things to try, but no avail. I convinced him to send me another ICD program disk (i figure that since I configure my C partition from the floppy and that there are some major problems that maybe the source disk is corrupted.) The interesting thing is that D: and E: partitions just work like normal. Some files bomb on D: and E:, but not everything. I have been able to install Flash and Wwriter onto E: for now and this works (based on the ability to send this message out!). I can't put any programs into AUTO or any desk accessories without it bombing on bootup (annoying because I can't use TURBOST), but anyhow.....

H E L P !

ANy suggestions would be greatly apprciated!

Please email me at ac365@cleveland.freenet.edu with any ideas or if you just require clarifications of my ramblings.

Thank you immensely..

Also, if any one knows of Atari service in Philadephia, pls let me know!

Is it valid to use vro_cpyfm to copy an image from one area of memory
to another (the screen) if they have different WordWidths? I tried to
copy from an MFDB with word width 2 to one with word width 80 (ie. screen),
but is tried to stretch out the narrow image over the whole screen.

Could someone tell me the exact semantics of vro_cpyfm.

If it's the program that causing the problem you're out of luck unless
someone updated it for the STe. Could the problem be...just a guess
here...a mouse accelerator program in the auto folder?

Hi there,

having too much money we bought some fancy laserprinters (not the
ATARI SLM) and now want to link them to our ATARIs.

First we got a CANON LBP-4.

This machine gives no reaction when connected to the ATARI parallel
port, but works fine when connected to any IBM clone.

Second we got a QMS PS-410. Wonderful machine with two ports and
Postscript capability.

And again we get no reaction when this QMS is connected to the ATARI
parallel port. Everything is OK when an IBM clone is used.

What is special about the ATARI parallel port?
What must be changed in the ATARI or the Laserprinters or the
connecting cable to make the ensemble work together?
Neither the parallel ports of an 1040ST, nor MEGA2 nor MEGA4
do work.

We would very much like to obtain some help or the investment
of several kDM is in vain.

Please Help

Kurt

3375. Conclusions: How do I stop Control-C?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-04 19:16:01 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <ePkR82w164w@ersys.edmonton.ab.ca>
Source record: 47014
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

About a week ago, I posted a message asking how to prevent the ST from aborting a program while waiting for input or sending output if Control-C was pressed. I received a number of suggestions, and here are my conclusions:

1. Use BIOS functions. Bconin & Bconout work fine to get characters and send characters respectively. They also do not wait for the user to press return on input, which was useful. I found that when I read from the file, though, I had to manually convert '\n' characters into a CR, followed by an LF for the output to the screen to look correct.

2. Use getch() and putch() to do the input and output, and use cfg_ch() to modify the functions to use the BIOS calls mentioned above. This would be more portable than the above method, but I think it might be a tiny bit slower. I had problems getting this method to work for me, but I now realize that I would have also had to convert '\n' characters into a CR, followed by an LF for the output to the screen to look correct.

I would like to thank everyone who answered my questions to offer help.

BEWARE here - especially if you own an ATARI SLM-605 Laser Printer.

Recently I bought a SCSI hard disk with an ICD AdScsi Plus Host adaptor board managing a 100 Mbyte NEC SCSI drive (assembled by Power Computing Ltd., Milton Keynes, UK). It is a beautifully quiet little gem (it has no fan!) and works perfectly as a hard disk with my STE (fitted with 4 Mbyte Ram). However when I daisy chained my SLM-605 off its DMA out port (or indeed daisy-chained the hard disk off the SLMC-804 Laser Printer Box) then the printing on the Laser Printer was spoilt by a "ghosting" of each printed letter. This does NOT HAPPEN if I use a pre-STE computer (I have tried a Mega ST-4 and a 1040-ST). Also my STE's DMA output has been checked by Atari UK and is perfect. If I daisy-chain my Laser Printer off an Atari SH-205 or Megafile-60 hard disk, all works well.

All this points to some design fault with the ICD DMA throughput buffer arrangement that, for some reason I cannot fathom, is OK with OLD ST's but NOT with the new STE's. The "ghosting" of the fonts is clearly(?) caused by "echoes" of pulses in the connecting cables - so would suggest a possible mismatch somewhere. I observe that ICD do not fit any terminating resitors at the input bus pins of the 74LS245 tri-state octal transceiver buffer - so I would guess a large echo is returned along the line to the computer. However, provided the output impedance of the DMA port on the STE reasonably matches that of the Lead, I guess this echo would not be echoed

back (being a Physicist I know a little about transmission lines - but never hitherto had any practical problems with them). Since ICD seem to rely on this effect solely to quench line "ringing" (rather than do this AND terminate at each buffer input) it occurs to me that if the output impedance of the DMA of the STE has been altered from that of the earlier machines - then this possibly might account for the troubles.

WHY then does the hard disk work perfectly well for NON-LASER PRINTING jobs I hear you ask. I don't know but venture the opinion that when Laser Printing in the "bit-image" mode, the pulses are different i.e. closer together in time (they are a couple of microseconds apart on a typical bus wire input and about 3.5 to 4.5 Volts high - or so my Storage Oscilloscope tells me - SORRY, NO I have not looked (yet) at such pulses from older ST's to compare. Changing DMA Leads between those of ICD and ATARI certainly has an effect on the font "ghosting" - but does not eliminate it altogether (ATARI lead gives less "ghosting" than my 24 inch or so ICD Lead). Of course, ICD's error checking software could help here too - possibly?

Just one other bit of experimental observation to add to this saga. I discovered - purely by chance - that if I daisy-chained my Laser Printer off my old SH205 hard disk which was itself daisy-chained off the new SCSI Hard Disk (YES - I had ensured their LUNS differed!) then the printing was PERFECT - even with an STE!! This proves the "fault" is curable - so I am optimistic that someone out there will maybe have met this before and can tell me what to do (I CAN solder, change chips, do circuit mods etc.)

Finally this DOES SEEM to be a design fault - for a work colleague has a similar system with a SCSI Hard disk (again with an ICD AdSCSI Host Adapter) made by Evesham Micros (entirely different Company - as far as I know) - which shows EXACTLY identical symptoms.

So, provided you do NOT have an ATARI SLM-804 or SLM-605 Laser Printer, I would say go ahead and buy these lovely quiet little gems. In any case, I feel this problem will shortly be solved by ICD - I already have alerted them with a letter. Atari UK's repair workshop (Mr. Mark Bunce) has been extremely helpful with my telephone queries (although, strictly, mine is NOT an Atari Problem - for there would be no problem with an ATARI hard disk) - as indeed have Power Computing Ltd. - but they simply buy the ICD boards and assemble the disks.

Hope someone can solve my problem, W. Alan B. Evans

3379. Need questions answered

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-05 10:53:20 UTC
From: 72347.2767@CompuServe.COM
Message-ID: <910905105320_72347.2767_EHC43-1@CompuServe.COM>
Source record: 47017

I own a 1985 vintage 1040ST with the 3D Z-Ram (populated to 2 meg) and Rainbow TOS (6 chip set). I use my ST for writing (2-3 hours a day when I'm not teaching), programming (as much time as I can squeeze out), DTP (run a small national newsletter for writing teachers), and telecommunications (moderate the Computers and Composition Digest). I'm thinking of upgrading parts of my system. I've thought of a number of possible options but need some advice.

Upgrading the Monitor
==========
One upgrade path involves the monitor. I like to use color because I can see it better. I currently have the SC1224 monitor (and like its crispness in spite of the lower resolution). I've thought of upgrading the monitor to one which could handle higher resolutions in color or monochrome. I suppose I'm talking about a multi-sync here. However, a colleague has a 386SX with a high res VGA (640x480?) color which to my eyes is not as crisp as my lowly 1224.
Question 1:
What type of monitor will work on an ST, providing high res mono, and medium or low res color with at least the same crispness as my lowly 1224?
Question 2:
Which monitors from question one will also work on an STE with its new resolutions or on a TT?
Question 3:
How do high res color monitors handle monochrome? Do they get fuzzy? Do they allow me to assign a given color for the background and another for the foreground (say grey and black respectively)?

The ST itself
==========
I'd really like to have an ST with more resolution choices. I'd also like a larger case (like those PC-AT machines) with a power supply capable of driving the ST with 4 megs of memory on the Z-Ram, one floppy, and my two Supra drives. One way to get some of this is an STE; another is the TT--a 68030 would be a treat for this old 68K hobbyist. I hesitate buying an all-new system because I already have two "stand-by" machines from the early 80s. It would bother me just to set the old ST aside.
Question 1:
What upgrade paths are there for making my ST act like an STE or TT?
Question 2:
Does Integrand (or some other company) make a box that can hold the ST main board, floppy, hard drives, &c.? How would I connect a keyboard to such a modified ST?

ST Software
==========
I have a gigantic hypertext capable program that supplies a CLI, a full text editor, disk management, C-like (byte-compiled) macros--the whole nine yards. My teacher colleagues have all been sucked into the PC world. They like my program, but it only runs on the ST. Much of it would port to another system. (I ported an early version to the ST from CP/M 68K in 1986.) But recently I've added user installable menus and all that nifty-keen GEM stuff (that I never use). I'd like to port this code over to the PC (and, dare I say, the Mac).
Question 1:
Are there any source-code translators that can convert GEM calls into source that a C compiler for MS-Windows (or for the Mac toolbox) will compile?
Question 2:
I mentioned the program does hypertext stuff. Are there any Spectre users familiar with StorySpace on the Mac? I'd like to write a conversion program that will convert the CONTEXT files and macros from my ST program into a form that StorySpace will recognize.
Question 3:
Are there any writer/programmers with 2meg or more systems interested in helping me beta-test this software before wide release. A version is available on CIS, but the ST user community on CIS is rather small. Very few have downloaded the 400K+ total files the program relies on.
Question 4:
What is the current ST development C compiler? I use Alcyon--I know everyone thinks it's a dog, but I've found it to be (with the proper cajoling) practically bomb proof--which I've used since the old CP/M-68K days. I also have a copy of GNU-C, but it requires so much memory, that large programs that Alcyon compiles just fine won't compile on my system (2.5 megs!) because it runs out of memory. I only use it when I'm verifying a program before porting it to a Vax--easier to develop on the ST and then just compile the code on the Vax.

If you've gotten this far, thanks so much for your time. If you can help me out with answers, you can reach me at the addresses in the signature or through the `comp.sys.atari.st.tech' newsgroup. While I am cross-posting this to the `comp.sys.atari.st' newsgroup, I don't have regular access to it.

3380. AT-Speed problem on MegaST

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-05 13:17:41 UTC
From: dick@ccsds.ahold.nl
Message-ID: <2837@ahds.ahold.nl>
Source record: 47019

A collegue of mine recently bought a MegaST (4Mb) and had ATSpeed
mounted on it (this is some ROM-based AT emulator).
He has severe problems with his keyboard:
- characters are lost while typing
- characters are scrambled on screen etc.

Is there anyone with some experience with this product, and if so,
do these problems sound familiar ?

Dick.

>SH-205 or Megafile-60 hard disk, all works well.

Things are not all that great with the DMA port on the old Mega ST's
either. I have been unable to get the following three devices to work
together: a fairly new Supra 105 Mb hard disk, an Atari SLM 804 laser
printer, and a Supercharger PC emulator. Everything works just fine
when I boot with the hard disk and either the laser printer or the
Supercharger, but when all three are connected together, it doesn't
work---either the disk gives problems and the computer won't boot, or
the disk works but the Supercharger crashes, depending on the order in
which they are connected. The Supercharger manual alludes to this
problem and suggests a particular order of daisy-chaining, but it
doesn't work for me. I have tried these peripherals with two
different Mega-ST's and had the same result with both, so it's
unlikely a bad DMA chip. I finally gave up being able to print from
Supercharger and I now unplug one or the other of the printer or
Supercharger before I power up the machine.

I had given up on this problem, but your note gives hope that there
might be a fairly simple cure after all. Anyone with more electrical
expertise have any ideas what might be going on?

I disagree. It assumes that everybody else who uses your source code has the same library that you have. Even if it's popular & widespread (like MWC or something) it's still not portable.

There's a third alternative: use Crawio(c) for output and Crawcin() for input. These are GEMDOS functions, not BIOS functions, and as such are redirectable and other stuff. The redirection doesn't actually work before TOS 1.4 for some of the single-character I/O calls, but that's Yet Another Good Reason To Upgrade.

Can anyone recommend a good internal clock for an STe? I've seen the external Forget-Me-Clock II which is quite nice, but I'd prefer something a little less intrusive.
Any opinions/ideas gratefully accepted, and prices (pref.UK) would be appreciated.

Thanks in advance,
Jason Morris.

3384. STe & HDs

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-06 12:17:22 UTC
From: mlake@irscscm.UUCP
Message-ID: <1991Sep6.121722.763@irscscm.UUCP>
Source record: 47033

I'm having a screwy problem.

I have a 520ST and a 1040STe. I also have 20 meg and 80 meg Supra HDs which I normally run daisychained. Everything works fine with the 520ST. But when I plug the HDs into the STe I can't boot, in fact I can't even power up. The busy light on the 80 HD (the first drive in the daisy chain) freezes on (the busy light also freezes on if I try to power up the 80 HD with the connector not plugged into either ST). If I connect the 20 HD directly to the STe then I can boot up but I can't access all the files on the drive. I get read errors with certain files.

Here's the screwy part ... if I boot everything with the 520ST, then unplug the HD and plug it into the STe, then boot the STe everything comes up fine and I can access all the files!! But I have to do a complete boot (bring up the desktop). If I only power up and then unplug the HD from the ST then the busy light will freeze on once I plug it into the STe. Why is all this happening?

Also, it seems I need a floppy disk in the internal drive of the STe even with autobooting turned on for the system to come up. Is this normal?

Hi Marvin,
I guess that you are using the Atari softwareset(AHDI + HDX).
HDX uses a file WINCAP that contains the specifications of the
drives . Take a text editor and update the files according to
the specs of your new drive. It will probably take some trial
and error to find the right way to edit the file. There are
comments in the file that what all the parameters mean. You
basically copy the data for the SH204 and edit it to reflect the
specs of your drive.

I am not sure, but I guess you're right (must be, my 80M Seagate
SCSI drive has a ST296-N...
>NOW the question is... could I get a removable SCSI hard disk drive and hook it
>to my old ST with that supra-controller (that makes it look like mfm ?)
Well, it definately doesn't look like MFM. The point is that the
Atari ACSI bus is a simplified SCSI bus (only Atari knows why
they didn't implement a full SCSI). The board you have is a ACSI
to SCSI converter (A so called "hostadapter"). That is the same
thing as Atari uses in the Megafile 44 to drive the Syquest
SQ-555 removable harddisk. I don't know about prices abroad.
Prices here in Europe are around $500 for the bare drive with
one cartridge (44M). There is a newer drive from the same firm
that has 88M cartridges, but that one is more expensive (about
$900 I guess)
Success, Louis

>John M Williams jmw@probitas.cs.utas.au

I agree, there is some trouble with MWC's malloc() - my MWC manual
states that the most space it can "mallocate" is only 64k (unsigned int) -
so it should presumably never be used to assign larger chunks of memory - you
should use lmalloc() instead. In fact I almost NEVER use either malloc or
lmalloc - preferring to use the gemdos Malloc() instead. Amongst other
benefits avoiding "high-level" routines leads to more compact code.

Note though that Mark Williams Co. appear to have given up supporting
ST softare quite some time ago. One of their last communications to
registered users was an offer to buy the complete sourcecode of their "C"
library.

My main point is that you should not denigrate Malloc(), as this
is simply a gemdos call - and what it does will vary as Atari improve their
TOS versions. Since, indubitably, malloc() calls Malloc(), it could very
well be that, when last developed by MWC it worked OK, - but does not any
more due to subsequent changes to the TOS or gemdos made by Atari.

If you had the sourcecode, you could easily patch the malloc() to keep up with improvements in the gemdos functions (like Malloc()) that it uses. I would surmise that MWC would still be able to sell you their C libraries' sourcecode.

There's a little box with two additional RS232 ports, sold by Double Click software.

You should find their address in allmost every magazine or DC?????? program.

You are correct. I was assuming that cfg_ch was available to all C
libraries. Getch() and Putch() are commonly available it seems, but I
only heard about cfg_ch in this newsgroup. In general though, I still
think that the second method would be more compatible than the first,
since it doesn't access the system directly by skipping over the library.

Thanks for the comments...

I just got done sending the latest Program of the week to the terminator site (atari.archive.umich.edu) where you can ftp all of our freeware programs, just do a: cd atari/dc
and viola!

I also just sent the latest program to the moderated newsgroup. You should see the file this year... :-)

DC Drop DTR will drop the computer's RS232 DTR line for one second, then reassert the line. This should hangup any modem which is connected. Program suggested by James Faircloth.

100% assembly. ST, STe and TT compatible. Program of the week.

- mike vederman / double click software

Message-ID: <1031@ehviea.ine.philips.nl>
Source record: 47031

In article <A1424561951@thelake.mn.org> steve@thelake.mn.org (Steve Yelvington) writes:
|I'm looking for a program that will disassemble .o modules produced by the
|Mark Williams C compiler. I'd prefer that it produced standard Motorola
|asm, but MW's asm is acceptable (I can always translate by hand). Is there
|such a beast?
|
|I thought DISTOMWC might do the trick, but it won't -- it works only with
|DRI-format objects.
|
|Basically what I'm faced with is this: I have a library of high-level
|windowing functions that I want to use with Sozobon C, but it's available
|only in MWC format. I want to convert it. Source code is not available, so
|I have to go the harder route.
|

What you could do is link the .o files to be disassembled into a .prg
file (or .ttp or whatever). This could mean you have to add a dummy .o
file containing the unresolved references, to keep the linker happy
(some linkers proceed, but give warnings; you won't need a stub .o
in that case).

The big advantage of this scheme is that you are no longer dependent
from the format of the .o file. Any decent disassembler should
disassemble a program file nicely, especially when you have linked with
an option that preserves the names of the symbols in the program file.

If you don't own a disassembler (isn't DISTOMWC already one?) send me a
note. I wrote a disassembler for the ST some years ago.

Cheers,
Leo.

Well I would like to get one of those Datel , Key Board ones, 24 Pounds,
at least that don't use up the Cartridge Port and can be used when you are not
runing your hard drive, Plus they don't need software to drive it..

This article though distributed worldwide is primarily for the UK readers.
Apology to those who are offended/annoyed.

My friend bought a used Mega 2 that came with a mono monitor & a Triangle 40 MB Soft Innovation Hard disk. This is a autobooting type harddisk. On bootup the following sign-on messages appear.

Traingle turbo drive PCML Ltd.
Ver 1.2Er Room Boot RGH 12/9/88.

* (This is a British made product)

The drive works ok in ST mode. Next, my friend tried to install Spectre/128 system (V 1.9 Copyright 1988)that he bought quite long time when it was first introduced in the UK. He made five partitions. The first three are ST & the rest 2 are Spectre partitions. However, the Spectre program fails to recognise the hard disk & could not find any partitions at all. The main problem we have is that we could not find any manual for the hard rive. However, the diskutility programs are there.

The Harddisk utility & also a read.me file says that the drive is set at SCSI physical device no 7. Under Spectre we tried all possible SCSI device nos. with no result.

We seek help. If any reader of this newsgroup have any experience with this hard drive or this particular problem, please send e-mail to

Y.C.Wong@uk.ac.lut -> from within UK.
Y.C.Wong@lut.ac.uk -> from outside UK.

- Rahin

N.B. What is the latest version of the Spectre software that goes with Spectre/128 ?

Interesting problem, to say the least. A friend of mine who recently
bought a STe had to reformat his HD completely. Not sure if it was
because of the same sort of problems, or if he just wanted the bigger
partitions that 'Rainbow TOS' allow, though.

Does anyone know how to use the SPEECH.TOS program from the September issue of ST Format from another program? Could someone give me an example in either C or Hisoft BASIC? I think you should use the GEMDOS function Pexec(), but I don't know what's suppose to be in either the command or environment string. Right now all I can do is get the SPEECH.TOS to run from my program. My program can't tell SPEECH.TOS what to say.

>*** Kapiti At least I don't Flicker, ***
>*** New Zealand.. * not like a dying light globe ***

I purchased one of these keyboard clocks, although it was not made by Datel,
and found that all it does is to keep the keyboard processor in standby
mode while the ST is powered down.

This would be fine, except that in my case, the batteries gave out after
about a week or so without the ST being powered up for much time.

I would suggest that you enquire about the length of time that the clock
will run without the ST being powered up before buying one of these.

In the end, I bought a Dallas Semiconductor DS1216E smartwatch which consists
of a socket which fits between one of the ROMs and its socket. Once this is
in place you can forget it - all it needs is a small auto folder program to
fetch the time from the smartwatch and set the system clock.

One warning though, there is very little room between the ROMs and PSU in
some models of the ST, so fitting it may be a problem (I got around this
when I blew my PSU up and had to fit an external one 8^)

The program and some installation details are held at atari.archive.umich.edu
in the file atari/utilities/smrtwtch.lzh

Cheers, Trev..

3401. Mega boot problem

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-09 21:31:34 UTC
From: ericth@i88.isc.com
Message-ID: <1991Sep09.213134.22350@i88.isc.com>
Source record: 47092

A plea for help to those of you who know (maybe) about Ataris and their quirks. Certainly more than I do. Hence, the following plea for info...

A buddy of mine, non-technical (OK, he's a sales guy...) has a Mega 4(?) which just went belly up on him this morning - at least, the drive seemed to. He can't boot from the hard disk as usual. He called me (I am Mr. Computer in his mind, but I am Mr. Know-*NOTHING*-About-Atari, in my mind) for help.

Is he out of luck, if his drive is dead? Or can he just buy a new disk drive (from whom? where? what kind?)? He was moaning "why did I ever buy something w/o support - ohmygod, I'll have to buy a PC... Argh!"

Can you help me help my friend? Or point me in a possibly fruitful direction?

Thanx...

Eric Thiele 1-800-524-8649 x334

3402. ST OBJECT/EXE FORMATS

There is a C example of how to do this at atari.archive, but I wouldn't be
able to say where. I downloaded it long ago and converted it to Modula-2,
and since then, all I know of the program is that I have a module called
Speech:

```
DEFINITION MODULE Speech;

PROCEDURE LoadSpeaker(SpeakerProgram:ARRAY OF CHAR):BOOLEAN;
(* Initialise speaker. TRUE if successful *)

PROCEDURE Say(English:ARRAY OF CHAR);
(* Say something *)

PROCEDURE SayPhonetics(Phonetics:ARRAY OF CHAR);
(* Say something, using phonetics *)

PROCEDURE EnglishToPhonetic(English:ARRAY OF CHAR; VAR Phonetics:ARRAY OF CHAR);
(* Convert English to phonetics *)

END Speech.
```

If anyone wants a copy, mail me.

3404. Can interrupts in OS code be detected

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-10 14:58:43 UTC
From: dxper@dtek.chalmers.se
Message-ID: <4138@chalmers.se>
Source record: 47095

Is it possible to detect in an interrupt-driven TSR if a current operating-system call was interrupted?

Although I cannot claim to be an expert in MESSY-DOS programming, I think that a flag exists which can be checked so that a program can determine if it had interrupted the execution of a OS call. Is the same available on the Atari ST?

I'm curious because such a flag would enable the use of the OS system calls, which can't be called more than 3 times recursively...or so I have been told.

Yours,

Andrew Olausson

> [wabe@ukc.ac.uk]

NOW - the FIX - or at least it worked for me!

I suspected "echoes" or "line ringing" in the DMA Leads caused by some mismatch. When I noticed (in RadioSpares Catalogue) that you could buy several kinds of the 74LS245 tristate octal transceiver chip with different "speeds" (slew rates), I ordered three additional types - 74F245 (Fast), a 74AC245E (also quite fast in response) and a 74HC245 (made by Motorola - which has a C-MOS input, is about same speed as normal 74LS245N (that was in circuit on ICD board) but is claimed to be less sensitive to Power Supply Voltages - this chip will work at any Voltage between 2V and 6V). You will have guessed by now that this last chip worked perfectly - but not I believe because of its tolerance to Voltage variations - but rather because its input and output impedances matched far better the DMA bus transmission line impedances thus quenching the echoes. I should also add that the original 74LS245N that ICD had fitted was not faulty - for I replaced that with a "normal" one from the Lab here and the "ghosting" was just as bad. As for the other two (fast chips), they improved matters quite a lot but some "ghosting" remained - probably because their output impedances were far lower than the Line impedance to Laser Printer - so that echoes returning from the Laser Printer Box would be "echoed back" to the Laser Printer again (I surmise!). With the MC74HC245 chip, the older ST's as well as STE's all seem to work perfectly.

I trust this "fix" which worked for me will work for others also whom I KNOW experience similar symptoms. However they must be prepared to snip off the legs of the 20-pin 74LS245 chip and solder in the 74MC245 (or preferably solder in a 20-pin DIL socket so you can easily substitute these chips - as I did)

And perhaps ICD might care to do their homework on transmission line matching - and fit the compatible transceiver in the first place - even though it costs a few pence (or cents) more!

Cheers, W. Alan B. Evans

3406. Mouse click delay hell!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-10 16:38:28 UTC
From: rossin@hpfctgr.HP.COM
Message-ID: <35730002@hpfctgr.HP.COM>
Source record: 47097

I give up. When I try to detect a mouse button down event in a GEM application, event_multi does not return the event to my code until after the double-click time out period. The button up event happens with no apparent delay. I'm sure that the double click period (speed) is involved because I can vary this parameter with the control panel and the delay corresponds. I also tried setting the number of clicks in the event_multi call to 0, but the code behaves the same as if I specified 1. I also tried polling the mouse using the mk_graf_mouse(handl,&x,&y,&buttons,&keyboard) function which had the same delay that event_multi did.

I know that it is possible to remove this delay because I have Dr T's Tiger Cub. This code allows a graphical piano to be played with the mouse with no button press delay. I also believe that what I am experiencing is a feature that is similar to the keyboard repeat feature. What I need to know is how to disable this feature momentarily.

>>
>It seems that most UNIX developers add a IBM emulator product that allows
>UNIX users to access DOS on their UNIX machine. No one does a good job
>at it.

Since ST programs do not make use of the 68030 MMU, it is really easy to
let the ST emulation run in an area of memory allocated through the MMU.
The only tricky part is controlling hardware access. Obviously, if all
hardware registers are shared between TOS and Unix, chaos would result
from allowing both to access them freely. Therefore the TOS must either
provide new bios routines for the emulation under Unix, or some form
of mutual exclusion and/or value-storage must be performed on groups of
hardware registers.

In practice a combination of these two methods would probably make the
best solution. IMHO there is little point in a machine which can run
either TOS or Unix but not both together. How about it Atari?
Or maybe our German friends will get there first.

Such a flag does not exist. For checking if you have interrupted a
system call you can test if the processor was in supervisor mode when the
interrupt occured. If the supervisor bit is set it is likely that you have
interrupted a system call. Note that this bit is always set when the
processor is in supervisor mode, not only within system calls.

Assuming that speech.tos reads text to be pronounced from the keyboard,
the Pexec command should be called as follows:

strcpy(&command[1],"<filename.ext");
/* ^ hopefully the redirection works if not leave it out
* if it still does not work, to bad for you
*/
command[0] = (short)strlen(&command[2]);
/* short is assumed to be one byte in size if this is not true for your
* compiler use (char), perhaps that is better anyway
*/
Pexec(0,"PATH\\SPEECH.TOS",command,NULL);
/* PATH may contain a drive specifier */

It is certainly possible and fairly easy to check whether your code
interrupted some other code. Just check the return address on the stack
(and be aware of the status word on the stack too); it points just
after the code executing when you interrupted it.

|I'm curious because such a flag would enable the use of the OS system calls,
|which can't be called more than 3 times recursively...or so I have been told.

Most of them can't even be called more than once recursively, since
they depend on data saved at fixed places. Furthermore, the BIOS/XBIOS
save the registers in an area pointed to by $4a2. When you allow these
functions to nest, you will have to take certain precautions to make
sure you don't end up overwriting system variables (e.g. make $4a2
point to an area of your own, and make sure you use only that).

Cheers,
Leo.

If you ever ask for double click events, you'll wait for single click events in ROM TOS and Mega TOS. Unless I misremember, this bug was fixed in TOS 1.4, certainly by TOS 1.6. If you have Easy Draw you'll notice that its response to clicks that bring up the menu are much quicker.

If I remember correctly (this is some time ago, and I've switched to
Turbo C), there is a bug in the multiplication routine that is used
to calculated array element addresses: it uses a register (A2?) that
is not saved, and is assumed to be left unchanged by the code generator.
However, when possible this multiplication is converted by the code
generator to a shift operation.

This explains the observations of your friend. A friend of mine has
repaired this bug by disassembling the offending routine and patching
it, but I don't think I can supply the patched routine easily. Perhaps
someone else can, or else your friend can patch the routine himself.

Sorry, I don't know for sure the name of the routine and the register
that is destroyed. I *think* it is the unsigned long multiply routine
and register A2.

I hope this is useful.

3420. Strange problem

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-12 12:17:23 UTC
From: mlake@irscscm.UUCP
Message-ID: <1991Sep12.121723.8809@irscscm.UUCP>
Source record: 47107

I have a problem in a program that's just about to drive me crazy. I have been trying to find the cause for quite some time now to no avail.

I don't want to get into the effect because I don't think that will help. What I would like to solicit is anyone's idea on why a program would run differently from a floppy based system than it would from a hard drive based system. I am at my wit's end and am willing to listen to anything anyone has to say.

Thanks.

One thing for sure that can lead to trouble is the very simple fact, that a harddisk-installations eats up memory. Oxyd for example can't load all of its sounds, if I run it from harddisk (even when I boot up from floppy and only run the hd-driver...).

Then, there might be some program in your auto-folder which hooks into some routine that the troublesome program wants to be clean. Or some accessory.

Greetings,
RIPLEY

Replying to my own post.... sheesh!

I just noticed tonight that it depends on the direction of first
movement after reset - i.e. if it's upwards, then it keeps going up.

I hope it's the mouse, but I can't think of any reason why the same
signal should be sent for both directions.

Any ideas 2?

I used to have this problem a while ago. Doesn't seem to happen anymore
but .... what I used to do was simply give the mouse plug near the port a
little 'jiggle' or else unplug and replug it, and the problem would correct
itself everytime. I am not sure if a connection went bad, and didn't want to
really look into the logistics of why then it would always go down... but
as I said, just messing around near the port a bit always brought the mouse
back up to par.

3424. Help a beginner with event handling please?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-13 08:47:23 UTC
From: rodent@netcom.COM
Message-ID: <1991Sep13.084723.13433@netcom.COM>
Source record: 47112

I'm trying to port a totally event-oriented program to the Atari.
It has no trouble on the Amiga or Mac, so I figure it should be
straightforward:

I need to receive messages when
1. Either mouse button goes up or down
2. A key is pressed
3. A menu selection is made
4. A gadget box is clicked
5. The pointer moves

2, 3, and 4 seem to be no problem. However, AES seems to want me to
wait for a "particular mouse button state", not wait for changes in
that state. In other words, it appears to NOT be event-oriented...
well, it just has a limited idea of what a "mouse event" is.

It seems I can get messages continually by waiting for 0 clicks;
this gives a constant stream of button events and I suppose I could
generate mouse-move and button-change events myself by tracking
the previous values of everything, but a real event-driven GUI
wouldn't require the use to do this. Is this the Right Way,
knowledgeable folks?

BTW I'm using Lattice 5.06.02 on a TT.
Also, I'm STILL looking for a bitmap-font editor that will enable me to
port a 7x11 pixel font to the Atari. Any tips?

3425. gcc and gxx (gnu)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-13 13:29:20 UTC
From: arshad@siesoft.co.uk
Message-ID: <1991Sep13.132920.8524@siesoft.co.uk>
Source record: 47116
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to run gcc & g++ on my atari ST Mega4. I only have a single double sided floppy but there is 4M of memory, part of which I can use as ram disk. My questions are :

1) Is this configuration adequate for gcc and g++ ?
(I know I should have a harddisk but I cant afford it at the moment)

2) Which files beside tos/gcc/bin/gccbin00.zoo I need for gcc from terminator ?
(libraries/includes/docs etc).

3) Is gcc better than Sozobon C ?
(ANSI C).

4) Is g++ a preprocessor or a compiler ?

5) If I get gxxbin.zoo,gxxlib.zoo & gxxinc.zoo, Will I still need gccbin etc? Are there any docs for g++?

6) Will there be a gxxdb (gdb for gcc) for gxx?

Please reply by email (arshad@siesoft.co.uk) and I will post a summary on the net.
Thanks in advance.

After having my kids put some very heavy duty on my machine, I lost the use of the mouse in the way described -- one axis ok, but the other flaky -- sometimes movement in one direction (slow), regardless of how the mouse is moved. It happened twice to me (Dungeon Master and Chaos Strikes Back were involved) and both times it was a broken wire in the mouse cord. It is possible to solder the darn thing, but the results (in my case, at least) aren't very satisfactory -- you end with a thick wad of tape or shrink-wrap where you splice it since there are about 7 (or is it 9?) conductors in that thin cord. The best solution (other than getting an infra-red mouse with no cord) is to go to the nearest dealer (or write a letter to Best Electronics) and get a replacement cord. I paid about $8 for a cord, and it was very simple to install.

Date: 1991-09-13 17:22:54 UTC
From: steve@thelake.mn.org
Message-ID: <A1658525485@thelake.mn.org>
Source record: 47117

```
[In article <3217770@alice.hobby.nl>,
harold@alice.hobby.nl (Harold van Aalderen) writes ... ]

> Assuming that speech.tos reads text to be pronounced from the keyboard,
> the Pexec command should be called as follows:
>
> strcpy(&command[1],"<filename.ext");
> /* ^ hopefully the redirection works if not leave it out
> * if it still does not work, to bad for you
> */

This is NOT the way to redirect input. The '<' character is not
interpreted by TOS.

It may or may not be meaningful to the child process. Some writers of
runtime startup modules have coded them to look for '<' and '>' and
attempt to process them as redirection operators. There are reasons
why this isn't a good idea, but I'm not going to go into that now --
the point is simply that you can't depend on it, and you don't NEED
to depend on it.

The right way to redirect input is to use the GEMdos Fdup and Fforce
facilities. They are poorly documented in the common literature (I'm
talking about published works; I don't know if developers have
something better).

Here is an example of input redirection.

#define STANDARD_INPUT 0 /* see below for more info on handles */

int saveconsole; /* place to save standard console handle */
int inputfh; /* handle of file to which we'll redirect input */

inputfh = Fopen("filename.ext",0); /* open the input file */

/*
* Insert code here to handle possible Fopen error
*/

saveconsole = Fdup(STANDARD_INPUT); /* we'll need this later */

Fforce(STANDARD_INPUT,inputfh); /* force redirection */

/*
* Now execute the child process using Pexec or your favorite library
* function, and when it's done, restore the console.
*/
```

```
Fforce(STANDARD_INPUT,saveconsole); /* back to normal */
Fclose(inputfh); /* close the input file */
```

The ``#define STANDARD_INPUT 0'' directive refers to one of the standard handles (already opened by TOS), which ordinarily refer to character devices but may also refer to files if redirection has been performed. Here are the standard file handles and their defaults, according to Mike Fulton at Atari:

```
handle device
---------------------------------------
0 Gemdos standard console input
1 Gemdos standard console output
2 RS-232 port input/output
3 printer port input/output
4 MIDI port input/output
5 Gemdos standard console output w/extended chars
---------------------------------------
```

There also are three more standard handles that always refer to character devices:

```
name handle device
------------------------
con: -1 system console
aux: -2 RS232 port
prn: -3 printer port
------------------------
```

You don't have to call Fopen to use these handles, but if you do call Fopen with the corresponding device name instead of a filename, you'll get the correct handle as a returned value.

Note that these are negative 16-bit values, not 32-bit values. Some documentation of the Fopen call suggests that it returns a 32-bit value, but that does not seem to be useful. Also note that some documentation suggests that any negative value returned by Fopen signals an error, which also is not the case.

There is a program available from a.a called mouth3 I think that enables you to call the speech program. Or it tells you how to do it - I forget. At any rate, I have a C function that I can pass a string to which will then "speak" it. You have to patch some parts of speech.tos (on the fly) for it to work, but it is described in mouth3. If you have trouble, email me and I could probably send you my code.

As others have mention, this could be the cord, though the
reversal in direction suggests its not. I had a similar problem
with three Atari mice. Always in the horizontal direction.
A friend of mine found the solution from a local company
that had about 13 mice die like this. Their tech said that the
phototransistor in the mouse drifts if left on continuously,
and the resistor biasing it needs to be increased to compensate.
(At least that's what I think he said. I know just enough about
electronics to be dangerous.)
Anyway, for the horizontal direction, r3 on the mouse circuit
board needs to be increased about 10%. I don't know which resistor
controls the up-down movement, but I'm sure someone out there will.

if this is what i think it is (an old program), then i can post a "talk"
program i wrote used in conjunction with speech.tos. it will speak whatever
you type, either words on the command line, or from stdin or from a file,
as i recall. cute. how about manpages that _talk_ :-) or compilers which
yell at you when you make an error. i like to watch my cat when the ST
calls her name. how about voice mail? the possibilities are endless tho
confuse-a-cat is my favorite application...

if i have time, i'll upload src+bin to atari.archive over the weekend.
look for file "speaktlk.arc" next week. i will include the speak program
since it may be different than the one you have. you have to load/nogo
then jump to specific addresses. i'll port it to gcc (-mshort) from the
alcyon C (what i wrote it in).

MWC has a LOT of strange errors. Its not supported anymore, its
a bad compiler anyway.

Although the documentation is incredible, it may be worth the price alone of
the compiler!

I had to pull it out recently to compile EMACS as Turbo C doesn't like
it very well to chew on..actually I have to update the code to ANSI.

But, anyhow, dump it and get Turbo C. It has more than its fair share
of code generation errors, primarily from the optimizer...

BUT you can see these errors, and correct them easily with an incredible
source debugger that must be seen to be believed.

There are some problems with GEMDOS redirection and the program SPEECH.TOS in that it does not know what to do when the Cconrs() function returns a zero length line (signalling EOF) nor does it interpret a 0 return from Fread() correctly as EOF.

These are both problems in the prog and not really GEMDOS's fault.

> that the total number of bytes was a number divisible by 4.
>
there is nothing wrong with mwc. C allows the compiler to
align structures and structure member at whatever alignment boundary.
the the 68000 the minimum alignment restriction is a short word
boundary (16 bit even address boundary). So what mwc is doing is
perfectly legal.
on a 68020/030/040 etc, it is more efficient to align on a
longword boundary.
gcc aligns structs/members on short words when -mshort (16 bit
default integers) or on long words when no -mshort (32 bit default
ints). when gcc is told to generate 020 code, it always aligns on
longword boundaries.
structures also always have to be padded up to the alignment
boundaries so that pointer arithmetic and arrays of structs work
correctly.

>after the code executing when you interrupted it.

Well naturally this is so, but that is not an acceptable way of doing things
because if I'm not mistaken parts of the OS code could have duplicated itself
into low RAM and execute part of a OS call at that location. Also, with the
TT it could be possible that virtual memorty schemes would be employed and
then the return address on stack would be worth zilch in this context.

>Most of them can't even be called more than once recursively, since
>they depend on data saved at fixed places. Furthermore, the BIOS/XBIOS
>save the registers in an area pointed to by $4a2. When you allow these

Well, does this mean that a scheme for checking this address could detect
whether or not an OS call were in exe at time of interrupt?

Yours,

pao

Well, for some time hard disks on ST's were very rare. The ST system was basically floppy based for several years. This resulted in a lot of software which has "a:\...." in it (ie hardcoded to work only from the floppys). Other factors which might affect this are copy protection (physical copy protection can only be done on floppies, and are thus restricted to them) and also "demoes" which are crippled to only run from the floppy (to encourage users to purchase the uncrippled version). Most commercial games will not work on a hard disk. This is because 99% of ST game purchasers do not have a hard disk, and game programmers know this (and it is easier to say a: than to look up the current logical drive from the os). As a final note, some programs have config files which are initially set for a floppy based system (again because that is most of them), but can be changed for a hard disk based system. I seem to remember that Personal Pascal was like that; You had to go in an edit a text file before it was able to find anything.

I have dealt with this problem many many times (since purchasing my hard disk). Please feel free to email some details, perhaps I have encountered this particular program.

It may be adequate for gcc, but probably not for g++. I think g++ takes a minimum of 2 Meg. of memory, so at least it would be a tight fit in which you couldn't compile any 'serious' programs. The 4 Meg. would be enough to run both comfortably if you had them on a hard drive.

>
> 2) Which files beside tos/gcc/bin/gccbin00.zoo I need for gcc

You will also need the library from tos/lib/bin and the includes from tos/include/bin.

>
> 3) Is gcc better than Sozobon C ?
> (ANSI C).

gcc is ANSI C and Sozobon is not, so gcc is 'better' if that's what you mean by better. I think the optimization is better in gcc as well, but on the down side, gcc takes up more memory (see above!).

>
> 4) Is g++ a preprocessor or a compiler ?

It's a full-blown compiler which uses a lot of code from gcc. I think starting with version 2.xx, gcc and g++ will be integrated into one compiler.

>
> 5) If I get gxxbin.zoo,gxxlib.zoo & gxxinc.zoo, Will I still
> need gccbin etc? Are there any docs for g++?

Yes. No documentation that I know of, execpt that g++ tries to be faithful to the standard C++ from AT&T.

>
Well, allow me to disagree with you...I find MWC an exceptional compiler
for its time. As a matter of fact I think it was the best compiler around
until Turbo-C came along (note: I've not used Turbo-C, but reading this
newsgroup regularly, and running programs compiled with TC, I've concluded
that it's the best C compiler on the ST today)
However I've tried Megamax (the old one), Sozobon, Laser, & Prospero C
and I find them all inferior to MWC.
I don't know how you came to the conclusion it's a "bad compiler anyway"
but I think you shouldn't say things without justification.

The thing that MWC behaves like the Unix cc, and that it was the official C
compiler for the ST for a while (approved by ATARI) should mean that at least
it's a decent compiler.

I'm using it for 3 years and never had a complain...

Unfortunately MW stopped supporting it.

>Although the documentation is incredible, it may be worth the price alone of
>the compiler!
>

I agree that the documentation is incredible and I have the same opinion
for the rest of the system too.

>I had to pull it out recently to compile EMACS as Turbo C doesn't like
>it very well to chew on..actually I have to update the code to ANSI.
>

I have never found C source code for an ST program that could not be
compiled under MWC with NO or MINOR changes...This means a lot for a
c compiler.

>But, anyhow, dump it and get Turbo C. It has more than its fair share
>of code generation errors, primarily from the optimizer...
>
>BUT you can see these errors, and correct them easily with an incredible
>source debugger that must be seen to be believed.
>

>--Greg

I also think that today Turbo-C is the way to go (it's new, ANSI compatable,
and comes from Germany), but I would never say that MWC is a bad compiler....

cheers

3439. What about the icons

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-15 08:10:52 UTC
From: pno@aifh.ed.ac.uk
Message-ID: <1991Sep15.091052@aifh.ed.ac.uk>
Source record: 47128

I am trying to write a GEM application which puts an icon
on the desktop when a window closes and then allows them
to be moved around, selected etc as usual. However, there
seem to be no support functions in the AES for icons to
handle this. Does this mean I have to write a complete
icon manager on the same lines as the window manager?
Does anybody have any sample code that does this kind
of thing???

>===|_________________________

Well, from my above statements, I mean bad compiler by the following:

1) No IEEE STANDARD floating point support.

2) No software debug tools, that are useful anyway.
a) CSD is a joke, and YOU KNOW IT. Its much asier to use printf's all
over hell, which of course takes even MORE TIME TO COMPILE.

3) It wastes too much time with its screwy disk trees it makes for
everything. There are much faster ways to parse code than to write
HUGE data files to disk.

4) Its a memory hog. ITS REALLY REALLY a memory hog with CSD.

5) Its also a disk space hog, just sitting there the thing takes up
EL MUCHO amounts of HD space.

6) Its not integrated, as in compiler, editor, linker. Therefore its
EVEN SLOWER. Its great though, as I use to make sandwiches and
catch up on the news while the thing compiled my programs.

7) Its not ANSI, like you pointed out.

8) Last version I had STILL couldn't get 1677891>>2 right.

.
.
.

I would go on but I am afraid I would overload the IP net.

The compiler system was really made for something in the 020 range
in my humble opinion. Not for 68000 machines.

>virus...)
>

This happened to me when I first got my ST. A fix was possible by taking the mouse apart and cleaning every little lint booger out of it (it is unclear if the cleaning or the taking-apart fixed the problem). After doing this twice (within 1 week of getting my ST), I sent the mouse back and got one of the new ST mice (round ball door, large teflon roller sleeves). This mouse has performed through almost 4 years of hard use without any problems at all. I think the new Atari mice are far better than previous designs. You have an old one if your ball door slides to open, and if the roller bars are thin bare metal.

No argument here...MWC uses the DECVAX format, probably because Mark Williams was originally supporting DEC machines. They should have supported IEEE format

>2) No software debug tools, that are useful anyway.
> a) CSD is a joke, and YOU KNOW IT. Its much asier to use printf's all
> over hell, which of course takes even MORE TIME TO COMPILE.
>
CSD is not very good because it is outdated & slow (and gets confused when negative numbers are involved). But it was the first C-source-level debugger available on the ST...when it first came out was the best debugging tool around... Remeber, I claimed that MWC was an excellent development system at its time. I still believe it's a good development system with a somewhat outdated source-level debugger.

>3) It wastes too much time with its screwy disk trees it makes for
> everything. There are much faster ways to parse code than to write
> HUGE data files to disk.

Faster doesn't always mean better...for example, Laser C is one of the fastest copilers on the ST, but its parser is by far inferior to MWC's.

>The compiler system was really made for something in the 020 range
>in my humble opinion. Not for 68000 machines.
>
>--Gregory
>
>I have SAID my PIECE!

Well, I admit that MWC is not the best package for the beginner C programmer,
and it's not the fastest compiler around. But it is clean, stable and produces
quite good executable code. IMHO it's still the best *cc-like* compiler on the
ST because it uses much less space (disk and/or memory) than gcc, and it's much
more reliable than sozobon-c. It also uses one of the best parsers I've seen.
However for serious programming it requires at least 1 meg RAM and a hard-disk,
but once you have them you have no problem. Furthermore it's a matter of
preference...I consider command-line oriented interfaces to be IDEAL for
software-development...and don't forget that you don't have to stick with
msh...there are a lot of other cli's available (gulam, bash, ksh, mupfel, etc)

Anyway, Greg I don't mean to start a flame war (and I appologise for the
"wasted" bandwidth). I have nothing against you; I just don't think newcomers
should consider MWC a bad compiler..it's simply kind of outdated.

I'll be happy to continue our discussion via personal e-mail, since most of
the other people on the net are probably not interested in it.

have a nice day

I suffer from intermittent mouse insanity. Too cheap to buy a new mouse (why
do you think I bought Atari/), I pulled the little beast apart and cleaned
and reseated the connector strip thing that connects the cord to the circuit
board. The rodent jumps and frolics like new again, except for the left
button which is just plain worn out (Dungeon Master and Chaos Strikes Back).

I could actually see accumulated detritus on the connector contacts.

I pulled the source for Perl v4.0.10. MwC breaks on the
number of include pragma's, the use of defined (SYMBOL) || definded
(SYMBOL2) code and the lack of some standard include files.
There is some code to be written, but the goal right now
is to port PERL to TOS.

The idea that I had over the weekend, is get the cpp from gcc
and use it instead of the cpp from MWC and see if that will increase
the capability. I want to use MWC for the code generation and
the symbolic debugging capability.

Atari will aprove anything they can't be ars*d to write themselves.
Atari (head in the sand) UK are shipping developer kits with an old version 2
of MWC.

> Unfortunately MW stopped supporting it.

This is sad.

> I agree that the documentation is incredible and I have the same opinion
>for the rest of the system too.

The manal *is* great. A bl**dy good reference on C and GEM.
I bought my copy of MWC second hand for 20 quid for that reason alone.

> I have never found C source code for an ST program that could not be
>compiled under MWC with NO or MINOR changes...This means a lot for a
>c compiler.

I got this four line compact maze program for Un*x machines from the net once
and MWC compiled straight off. No other compilers would look at it becuase it
was using the C language to extreme. The only thing I had to change was the
random number generator part because the ST version was returning a 16 bit
instead of 32. But it compiled!

> I also think that today Turbo-C is the way to go (it's new, ANSI compatable,
>and comes from Germany), but I would never say that MWC is a bad compiler....

Haven't Borland dropped Turbo C and given the rights back to the original
developers? I believe it is now called Pure C and is being distributed by
Application Systems in Germany.

Now some questions for Turbo/Pure C users:-

* Does the compiler support parameter passing in registers and if so
can this be disabled for all or selected functions?

* Can a DRI compatible object file or library be linked with little
or no modification? If so then how does it cope with the 8 letter
symbols? Does an 8 letter match constitute a match when accessing
a DRI symbol?

* What is the airspeed velocity of an unladen swallow?

Why am I intereseted? Because the standardising of link formats between ST C compilers would be a great boost to the ST market. DRI link format is not great but it is/was supported by MW, Laser, Sozobon and Alcyon C compilers.

The PC world abounds with libraries that can be used with any compiler.

Perhaps it looks for a file on the floppy or checks certain sectors on the
floppy or perhaps it is just to deep in your folder structure on the HD
perhaps it thinks drive C: is its own RAMDISK accessably by its own routines
perhaps it makes use of the DMA registers to speed up floppy IO and conflicts
with the HD driver perhaps there could be a million other reasons

Maybe it is not a bad idea to enlighten us about the program itself,
what does it do, how is it installed, how was the situation on the floppy
based system, what did you try to make it work etc etc

Not everyone thinks `integrated' == `better'. I'm tired of learning a
new editor everytime I switch compiler vendor; and compiler/linker
integration is best accomplished via Makefiles (imho). Ghods save us
from integrated environments designed by fascists.

Agreed.

The FTL Modula-2 compiler had the Compiler integrated with the Editor, with error line feedback returned in some bizarre way. Now that I use vi, it is on occasions annoying not to be told what LINE the error is on (it does give the context of the error, so it isn't too bad).

3450. Wierd experiences with the rs232c port

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-17 01:38:54 UTC
From: carter@cae.wisc.edu
Message-ID: <1991Sep16.203855.15295@doug.cae.wisc.edu>
Source record: 47135

I seem to have small problem, which I haven't been able to track down.

I have this small rs232c application, that when I first ran it, I had my modem on and unfortuneately, anything it sent out the rs232c port, was immediately echoed back by the modem...

I killed the program, but the rd/sd lights continued to flash wildly on my modem...I noticed the rs232c port was simply screwed up royally, and didn't seem to accpt bios commands anymore...

I reset my computer, and they stopped....(Lights flashing that is..)

I can do this consistently..and I would like to know..

WHAT THE SAM HELL IS GOING ON HERE WITH TOS?

I have a Mega STE.

--Its not my modem either, OK, I turned it off and on and the dam port was still going nutso.

---Any assistance greatly appreciated, as in BUG work arounds.

Thank you for your time...

Smoochy, Gregory

I am making a despriate attempt to write a programm that involves outputting to the modem. *sigh* For the most part, I am a novice programmer. This is the first time I have ever attempted to do this sort of thing so, here's what I am trying.

I am trying to use Cauxout() and Cauxin(). Is this the only/best way to do this? I have tried everything, outputting integers, ascii numbers, strings... I give up and ask for your help.

Oh, if it is of any consequence, I am working in C :-).

Thanks in advance!

YES you can, YES it can - with the function modifyer 'cdecl', the modifyer
'pascal' tells the compiler to pass parameters in reverse order...

> * Can a DRI compatible object file or library be linked with little
> or no modification? If so then how does it cope with the 8 letter

Yes Turbo C supports both DRI and their own linker format. The old TC's
only use DRI. TC's link format supports long symbols, and is much faster.

> * What is the airspeed velocity of an unladen swallow?

easy, RED!

This is why you also get commandline versions of the Compiler TCC,
PreProcessor TPP and the linker TLINK...
The assembler MASM can also be used from commandline...

3455. DC weekly program post

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-17 16:45:14 UTC
From: uace0@menudo.uh.edu
Message-ID: <1991Sep17.164514.13904@menudo.uh.edu>
Source record: 47045
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This week's program has been sent to the ftp site atari.archive.umich.edu and to the moderated newsgroup comp.binaries.atari.st.

DC No Alert will keep an alert box from being displayed and will 'fake' return of the DEFAULT button. So, in an alert that says, "Really Quit?" with the YES button being the default, you'd hear a little 'bing' and that's it. The YES button will be returned as the button selected. 100% assembly. ST, STe, and TT compatible. Program of the Week.

|Now some questions for Turbo/Pure C users:-

| * Does the compiler support parameter passing in registers and if so
| can this be disabled for all or selected functions?

Yes to both, if it still works the same as the year-old version I have.
The keyword `cdecl' allows you to declare a function that passes args
on the stack instead of the default register passing.

| * Can a DRI compatible object file or library be linked with little
| or no modification?

If no debug output is specified, TC can be made to produce DRI format objects.
I find this a big drawback, since you're obviously limited to 8 character
identifiers. This is eased somewhat by the fact that TC can use all 8
characters (leading _ for C functions is optional). Still, the HiSoft
extended symbol format is *much* better, and is now supported by both
Lattice C (and other HiSoft tools), GCC, and Atari's debugger.
That's only for executables, tho...

|Why am I intereseted? Because the standardising of link formats between ST
|C compilers would be a great boost to the ST market.

Weeeelll... library formats are another thing altogether. Every compiler
that I've used has a different library formats. Whee! Almost all of 'em
will produce executables with DRI format symbols, though. I'd like to see
a standard library format, too. It makes it real hard on developers trying
to share code, especially world-wide.

| * What is the airspeed velocity of an unladen swallow?

African, or European variety?

(Trivia question: why was MWC used for FSMGDOS instead of GCC?

Because the cross-compiler used by other parties to make parts of
FSMGDOS output MWC format object files. This means that FSMGDOS
doesn't use hardware floating point to best advantage. Don't get me
wrong, FSMGDOS is no slouch when it comes to speed!!! Runs circles
around TrueType and ATM font generation. But later we found out that
the company used GCC for internal porpoises! Does this mean that
someday there may be an FSMGDOS that uses a 68881 or 68882? Maybe!)

I agree with Ross. Some of these integrated environments are crap.
I just started using Borland C++ on the PC here at work (sorry folks :-)
and it's shell should come with a sick bag. I like to pick what editor
I want and use sensible makefiles. Borlands tools are also 'full of it'.
Every one insists on telling you it's from Borland and none of their names
or flags are Unix flavoured.

I believe Lattice C is also 'integrated'. Oh well ...

Those functions, or the equivalent BIOS calls, will work fine. If you're writing a term program, you'll want to write a loop that polls the console and aux devices and, if they have data waiting, handles it. Determine whether data is waiting by calling Cauxis and Cconis, or the BIOS equivalents.

If you're still not getting anything in or out of the modem, the No. 1 suspect is the serial port's BPS rate. You can set this rate using the control panel or a CPX, and it will remain set when your program runs. If you want to set it yourself, see the documentation for Rsconf.

There seems to be a certain amount of interest in this subject, so I'm writing a basic ``how to'' document on serial communications on the Atari ST. I'll post it here for comments when it's a little bit farther along, and perhaps the final (presumably corrected) version could be archived at Michigan or distributed in comp.sources.

>
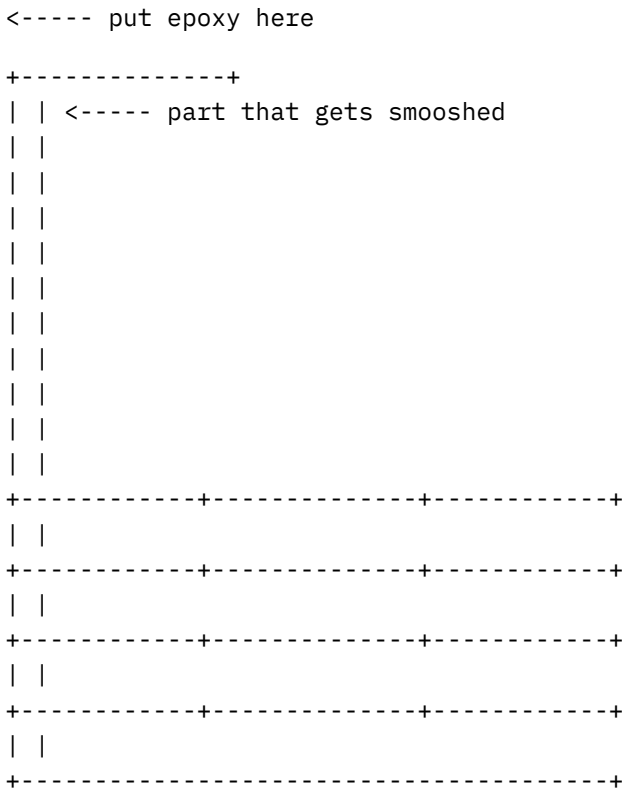
>I could actually see accumulated detritus on the connector contacts.
>

One common way that these buttons wear out is that the plastic part of the
switch itself (that which contacts the plastic piece on the top of the mouse)
actually compresses to the point that the switch is not pressed enough. There
are a couple of easy fixes for this. One is to relengthen the switch by
laying a bead of epoxy on it, then letting it dry. The other is to switch the
right and left button/switch units (requires about 2 minutes with a soldering
iron).



Side of switch unit, solder onto the circuit board inside the mouse.

3462. VRO_CPYFM Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-17 22:51:11 UTC
From: aking@bbn.com
Message-ID: <66358@bbn.BBN.COM>
Source record: 47054

I've been trying to use vro_cpyfm to save and then restore part
of a screen image. It seems pretty vanilla, but the vro_cpyfm which
restores the bits insists on using the screen's address instead of
the fd_addr in its source rectangle. What am I missing?

To give a little more detail, the program does the following steps:

```
1. Make and fill in an MFDB for the offscreen area:
*mem_mfdb = screen_mfdb; /* most things the same as the screen*/
mem_mfdb->fd_addr = big_buffer;
mem_mfdb->fd_w = w = rectangle_width;
mem_mfdb->fd_h = h = rectangle_height;
mem_mfdb->fd_wdwidth = w/16; /* like it says in the Lasar Manual */

2. Set up rectangles -- from arbitrary position on screen to upper left hand
corner of offscreen array:
pxyarray[0] = x; pxyarray[2] = x + w;
pxyarray[1] = y; pxyarray[3] = y + h;
pxyarray[4] = 0; pxyarray[6] = w;
pxyarray[5] = 0; pxyarray[7] = h;

3. copy the bits away
vro_cpyfm(wHandle, S_ONLY, pxyarray, &screen_mfdb, mem_mfdb);

4. draw in that area. ...

5. Set up rectangles -- from upper left hand corner of offscreen array to
arbitrary screen position:
pxyarray[0] = 0; pxyarray[2] = w;
pxyarray[1] = 0; pxyarray[3] = h;
pxyarray[4] = x; pxyarray[6] = x + w;
pxyarray[5] = y; pxyarray[7] = y + h;

6. Copy the bits back:
vro_cpyfm(wHandle, S_ONLY, pxyarray, mem_mfdb, &screen_mfdb);
```

I'd appreciate direct mail to aking@pebbles.bbn.com, as I am unable to
read the net at the present time.

Thanks for your help.

Allen King

From: steve@thelake.mn.org
Message-ID: <A408491826@thelake.mn.org>
Source record: 47051

I've been looking at implementing ARGV extended argument passing
under Sozobon C. I've managed to get kbad's example startup code
to pass through the Sozobon compiler, and I'm in the process of
massaging his execv() function. In the process, I've come up with
a couple of questions:

-- Is the char *environ[] external variable, which is found in some
C implementations (but not Sozobon C), supposed to reflect the
current environment or the environment that was present when the
program was invoked? In other words, does putenv() need to be
reworked to update the global variable?

-- Is the third (usually ignored) argument to main() commonly
a pointer to an array of pointers to char (like argv) or a pointer
to an array of char (as indicated in the dLibs documentation).

-- Are the Turbo C and GCC libraries in accord on the above points?

-- What do I need to worry about in regard to getting this to work
under MiNT?

--

Introduction

Modem i/o on the ST is isn't difficult. In fact, compared with other personal systems, the ST is unusually easy to program for serial communications.

The hard work is done for you. TOS includes interrupt-driven serial port routines. This means that when a character arrives at the serial port, TOS breaks away from whatever it's doing, grabs the character, stores it in a buffer, and returns to the task that was interrupted. You don't need to write code to do that.

The serial port buffers -- one for input, one for output -- are FIFO (First In, First Out) queues. TOS provides functions for reading from the input buffer, writing to the output buffer, and even changing the size of the buffers.

All you have to do is read from or write to the serial port as if it were a console.

The modem i/o routines

Both BIOS and GEMDOS provide functions for single-character serial
i/o that work exactly like their console equivalents.

>From GEMDOS:

Console Serial Description
------- ------ -----------
Cconin Read a character with echo
Cnecin Cauxin Read a character without echo
Cconout Cauxout Write a character
Cconis Cauxis Return TRUE if a character is available
Cconos Cauxos Return TRUE if output is possible, i.e.,
the output buffer has room for more data

There is not a serial port equivalent for Cconws, but you should be
able to write one easily enougth:

```
#include <osbind.h>
void Cauxws(s) /* write a nul-terminated string to the aux port */
char *s;
{
while (*s++)
Cauxout(s);
}
```

>From BIOS, the same function is called with different arguments
depending on which device is to be read or written to:

Console Serial Description
------- ------ -----------
Bconin(2) Bconin(1) Read a character
Bconout(2,c) Bconout(1,c) Write a character c
Bconstat(2) Bconstat(1) Return TRUE if a character is available
Bcostat(2) Bcostat(1) Return TRUE if output is possible

Note that the device numbers used by the BIOS are different from the
file handles used at the GEMDOS level. The BIOS device numbers may be
defined in this fashion:

```
#define BCON_PRT 0 /* printer */
#define BCON_AUX 1 /* aux (modem) port */
#define BCON_CON 2 /* console */
#define BCON_MIDI 3 /* MIDI port */
#define BCON_KBD 4 /* intelligent keyboard device output */
#define BCON_RAW 5 /* raw console output, no VT52 */
```

There is a no function to read a string from the serial port at
either the GEMDOS level or the BIOS level. For reasons that will
become clear shortly, you should write your own.

All of the GEMDOS and BIOS input functions return 32-bit LONG values.
In the case of the serial port, only the low 8 bits are interesting.
In the case of the console, the low 8 bits will contain the ASCII
code corresponding to the key -- if there is one. If the keystroke is

a nonstandard key, such as a function key, HELP or UNDO, the low eight bits will be a NUL value. In all cases, the upper 24 bits contain a unique keyscan code and information regarding the state of the shift keys.

A simple terminal program

A ``dumb'' terminal program using these functions is simple to write. All you need is a loop in which you will ``poll'' the console and the serial port. It might look like this:

```
#include <osbind.h>
#define BANNER "\033EIncredibly dumb full-duplex terminal version 0.1\r\n"

main()
{
int c;
Cconws(BANNER);
for(;;)
{
if (Cauxstat()) /* data waiting at the aux port */
{
c = (int) (Cauxin() & 0xFF); /* get it and clean it */
Cconout(c);
}
if (Cconstat()) /* data waiting at the console */
{
c = (int) (Cnecin() & 0xFF); /* get it and clean it */
if (c) /* if it's not a NUL from a function key */
Cauxout(c);
}
}
}
```

You'll notice that the above example runs forever. Well, not quite. GEMDOS console i/o processes control-characters, and a control-C will kill the program.

Of course, that means you can't send control-C out the modem port. That's one of many reasons it's called an ``incredibly dumb'' terminal.

You'll probably want to rewrite the program using BIOS functions and test for use of the UNDO or F10 keys.

Whatever happened to GEM?

None of this discussion has dealt with GEM. Why? Because so far as GEM is concerned, the serial port doesn't exist.

The AES Event Manager doesn't poll the aux port to determine whether an event has occurred.

If you want to write a GEM event-driven communications program that will cooperate with desk accessories for multitasking, you'll need to use the timer with a time value of 0. This will allow a task switch to take place, and when you regain control you can check the serial port's status with GEMDOS or BIOS.

If you're worried that the serial input buffer will overflow while some system-hog task is running, resize the buffer as described below.

The real world intrudes

None of the above functions cares whether the modem is live or dead. They only deal with data. If your caller falls asleep at the keyboard or abruptly hangs up, the above functions won't worry about a thing. If you're writing a communications program or a BBS, you'll have to deal with these real-world conditions. Modems and phone lines are not perfect.

There are many ways to handle such errors. In C, you might want to use the setjmp and longjmp functions to ``bail out'' and restart your program. Assuming you have set up a jump buffer called ``panic,'' you might write a low-level aux port input function that looks like this:

```
#include <time.h>
#include <osbind.h>
#define TIMEOUT 60 /* 60-second timeout */

int auxin()
{
clock_t time1,elapsed;
if (!rs232cd())
{
hangup();
longjmp(panic);
}
time1 = clock(); /* get tick time */

/* loop for up to TIMEOUT seconds, waiting for aux input */
for(;;)
{
if (Cauxis()) /* these could just as well be BIOS calls */
return Cauxin();

/* no activity yet, so ... */
/* get new tick time and convert to seconds */
elapsed = (clock() - time1) / CLK_TCK;

/* if too much time has elapsed, restart */
if (elapsed > TIMEOUT)
```

```
{
hangup();
longjmp(panic);
}
} /* continue the loop */
}
```

The above code has used a couple of functions that aren't in the library and bear some explaining. Here is the function that checks the carrier-detect status of the aux port by examining a hardware register:

```
#include <osbind.h>
int rs232cd() /* state of rs232 carrier detect line */
{
register long ssp;
register int *mfp, status;
mfp = ((int *) 0xFFFFFA00L); /* base address of MFP */
ssp = Super(0L); /* enter supervisor mode */
status = *mfp; /* get MFP status */
Super(ssp); /* return to user mode */
return(!(status & 0x0002)); /* check for carrier */
}
```

Here is a function that hangs up the phone line by dropping the DTR (Data Terminal Ready) signal. Note that most modems are shipped from the factory with DTR sensitivity disabled. You should be able to turn it back on by toggling a DIP switch or with a command from the keyboard.

```
#include <osbind.h>
void hangup()
{
Ongibit(0x10); /* dtr off */
sleep(1); /* wait one second */
Offgibit(0xEF); /* dtr on */
}
```

Now, what about getting a string from the modem port? You'll need to call your custom auxin() function, as above. Here is an auxgets function modified from the dLibs getln. Note that it uses a function ``auxput'' for output; you can rewrite or #define it to mirror the BIOS or GEMDOS-level routine you used for input:

```
#define KEY_CR 0x0D /* carriage return */
#define KEY_LF 0x0A /* linefeed */
#define KEY_BS 0x08 /* backspace */
#define KEY_DEL 0x7F /* delete */

char *auxgets(buffer, limit)
char *buffer; /* where keystrokes will be stored */
register int limit; /* size of the buffer */
```

```
{
register char *bp = buffer;
register int c, i = 0;
for(;;)
{
c = auxin() & 0xFF; /* mask off high bits, just in case */

/* end of line */
if((c == KEY_CR) || (c == KEY_LF))
{
*bp = '\0';
break;
}

/* backspace or delete */
else if(((c == KEY_BS) || (c == KEY_DEL)) && (bp != buffer))
{
--bp;
auxput('\b');
auxput(' ');
auxput('\b');
--i;
}
else if((c >= ' ') && (i < limit))
{
auxput(*bp++ = c);
++i;
}
}
return(buffer);
}
```

Configuring the serial port

In order to communicate with another machine over the serial port, speed and flow-control settings may need to be altered. Atari's XBIOS (Extended BIOS) provides a function that can configure the serial port. The function Rsconf sets the speed, flow-control and four bitmapped hardware registers.

Speed (bits per second, often incorrectly called baud) can be set to any of 16 values:

```
#define BPS_19200 0 /* standard */
#define BPS_9600 1 /* standard */
#define BPS_4800 2 /* standard */
#define BPS_3600 3
#define BPS_2400 4 /* standard */
#define BPS_2000 5
#define BPS_1800 6
#define BPS_1200 7 /* standard */
```

```
#define BPS_600 8
#define BPS_300 9 /* standard */
#define BPS_200 10
#define BPS_150 11
#define BPS_134 12
#define BPS_110 13
#define BPS_75 14
#define BPS_50 15
```

Only the values marked /* standard */ are commonly used in modem communications.

If you are using a slow- or medium-speed modem (under 9600bps) you probably will need to match the ST's serial port speed to that of the remote system.

If you are using a high-speed modem, you may be able to set the speed at 19,200bps and let the modem handle speed-matching chores. In this case, you probably will need to use RTS/CTS (hardware) flow-control to avoid overloading the ST's input buffer and the modem's output buffer. RTS/CTS is broken in most versions of TOS, and an /auto/ folder program must be installed to fix it.

Flow control can be configured to any of four settings:

```
#define FLOW_NONE 0 /* default */
#define FLOW_XONXOFF 1 /* control-s, control-q software */
#define FLOW_RTSCTS 2 /* hardware */
#define FLOW_BOTH 3 /* both hardware and software */
```

For binary file transfers, software flow control must not be used.

The hardware registers are not useful in ordinary modem-related programming, and altering their values incorrectly will have unpleasant side effects. Passing -1 to Rsconf will leave the corresponding setting unchanged.

Thus, to set bps rate to 2400 and flow control to none, the Rsconf function call would look like this:

```
Rsconf(BPS_1200,FLOW_NONE,-1,-1,-1,-1)
```

Parity and duplex

Parity is not commonly used in communicating with personal computers, but you may need to deal with it when communicating with a mainframe.

The idea behind parity is to provide at least a small degree of assurance that the transmitted character is the same as the received character. The way this is done is by fiddling with the high bit of each byte, which ordinarily would be zero for an ASCII character.

``Even parity'' means that the high bit is either set or unset, as necessary, to ensure that the result is an even number. ``Odd parity'' means the opposite. You can test this with the modulus operator in C, then strip the high bit by ANDing the byte with 0x7F or set the high bit by ANDing with 0xFF.

TOS also can generate parity values automatically if the proper hardware register is set. However, setting the register requires that you also worry about start/stop bits, word length and the serial hardware frequency, which is a can of worms.

Duplex is a potentially confusing term that describes whether you or a remote system is responsible for putting a character on your screen.

Most bulletin board systems run ``full duplex,'' which means that a keystroke from a caller is sent to the BBS, which then echoes that character back to the caller. This relationship is not symmetrical. The caller doesn't echo anything back to the BBS, because the echoes would be interpreted as commands.

``Half duplex'' means that each party is responsible for managing his or her own display. GEnie normally runs half duplex. Neither caller nor BBS echoes anything.

If you're writing a BBS or a terminal program with a ``chat mode,'' you may want to include a ``both local and remote echo'' option. This would allow the remote to run full duplex while you manage both your screen and the caller's screen.

>
> Please! Anyone! help!!!!!!

You haven't posted any code examples or revealed how you're getting the
data from the serial port. There are several ways of doing it. If
you're directly calling the BIOS Bconin function, and it always returns
the same value, then either your box or GFA's OS bindings are broken.
But it's impossible to diagnose anything without seeing a code example.

I posted a preliminary document on serial i/o programming a couple of
hours ago. You should read it carefully, regardless of whether you program
in C, GFA, Pascal, or whatever. The examples are written in C, but that
is only incidental; they are primarily examples of the properties of
TOS, not examples of C.

In a previous article, ninjam@csd4.csd.uwm.edu () says:

>I have the program looking ofr a char in the rs232 port. If one is
>there, it grabs it.
>But the problem is, is it's always grabbing the same character, as if
>the port buffer is not clearing......
Here's a get_key routine that I wrote in GFA. About the only thing not self-evident is that once a character is received, user| is set to 1 if the character was from the console, and 2 if received from the rs232 port. This routine needs to know if carrier is present, so I've included a GFA routine for carrier detect.

```
--------------------------------------------------

' Modem routines for GFA Basic - by Troy L. Nothnagel 11/16/90
' GET_KEY... key|=@get_key(user|)
'
' user|=1 -> Accept keyboard input only
' user|=2 -> Accept serial input only
' user|=3 -> Accept either keyboard or serial input
'
' carrier! = TRUE! if carrier detected, FALSE! if no carrier detected
'
FUNCTION get_key(VAR user|)
LOCAL key|
key|=0
DO
IF (NOT user|=2) AND INP?(2) THEN
key|=INP(2)
user|=1
ELSE IF (NOT user|=1) AND carrier! AND GEMDOS(18)
key|=INP(1)
user|=2
ENDIF
EXIT IF key|<>0
LOOP
RETURN key|
ENDFUNC

------------------------------------------

PROCEDURE carrier
IF (DPEEK(&HFFFA00) AND 2)=0 !Determine carrier detect
carrier!=TRUE
ELSE
carrier!=FALSE
```

```
ENDIF
RETURN
```

> program was invoked? In other words, does putenv() need to be
> reworked to update the global variable?

The current environment. putenv() should modify environ[] to reflect
any changes, and getenv() should use environ[] as well so that
getenv() after putenv() will return the new value for the variable.
Also, spawn() (or exec, or whatever) should build a new Atari-style
environment out of "environ" for passing to Pexec.

>-- Is the third (usually ignored) argument to main() commonly
> a pointer to an array of pointers to char (like argv)

Yes. (In fact, it's the initial value of the "environ" variable you
mentioned above).

> or a pointer
> to an array of char (as indicated in the dLibs documentation).

No. dLibs just uses the environment pointer in the basepage, which is
not in the correct format (it's a char * instead of a char **).

>-- Are the Turbo C and GCC libraries in accord on the above points?

Dunno about Turbo. The GCC library (and hence the closely related MiNT
library) follows the Unix conventions, as I've indicated above.
Indeed, you may want to grab a copy of either the GCC or MiNT library
source code and use the functions contained therein; I think these
parts of the library are pretty portable.

>-- What do I need to worry about in regard to getting this to work
> under MiNT?

Nothing at all; MiNT's Pexec is upwardly compatible with TOS's. The
only real (as opposed to cosmetic) difference between the MiNT and GCC
library startup code is that the former checks the cookie jar for the
cookie "MiNT" and sets the external variable _mint to the cookie's
value, if found. The user (and the rest of the library) can thus use
the value of this variable to decide what extra featurs of MiNT to
use, if appropriate.

Source record: 47060

Two comments.
One in the "soon to be constructed" serial buffer explanation please tell us whether the buffer is an array of chars or shorts. The dev. docs imply they are chars, but when you examine the buffer you see shorts. I'm specifically interested int the HI_WATER and LOW_WATER marks and whether I should assumed these treat the arrays as 16 or 8 bit wide items. I've assumed 16 bits (the worst case) and may be wasting 16K for the two buffers I've set up.

Two, in referring to documented hardware addresses is 0xFFFFF000 the same as 0x00FFF000 on a 68020/30 (it is on the 68000). On the 20/30, all address bits are significant. Has Atari redefined the peripheral and register addresses on the 20/30s so that we need to use 0xfffff000 instead?

Source record: 47066

I am part of a programming group here in Austin called Quantum Thump. We are creating networking software for BBS Express but are very dependent on a file that runs when someone logs off the board. It makes the amountof time taken to run our stuff after every log off becoming incredibly long.

What I have been trying to do is write an Accessory that looks at the time and checks it against a schedule. If the time is during that scheduled period, it would check the rs-232 port to see of it was active, if it isn't and the Hard drive is not doing anything, it will load our software and run it.

I can do the rs-232 checking and check for a HD busy signal, but I can't seem to get it to follow the correct time without causing the ACC never pass itself back to the other accessories. It just seems to hog all the accessory time. We are writing the program in GFA 3.6,so if there is anyone that can show me what I am doing wrong I would appreciate it.

3474. That new guy with the TT again (GDOS, Menus, Fonts)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-20 08:09:09 UTC
From: rodent@netcom.COM
Message-ID: <1991Sep20.080909.11715rodent@netcom.COM>
Source record: 47061

(I'm porting an application from the Amiga and Mac to the Atari TT).
Apparently nobody in this group knew the following, and therefore may be
interested to learn:

There IS a PD GDOS font editor that works on the TT. It's called GEMFED
and is available at umich. Also, the place to find code that illustrates
the usage of GDOS fonts is in the VDIT package.

Surprise discovery in the VDIT source doc: GDOS fonts require OFFICIALLY
UNDOCUMENTED functions. This is incredible! Imagine a graphical operating
system that doesn't document how to use bitmapped fonts! It staggers the
imagination.

Question 1: can someone recommend a book on GEM that gives gory, full
explantion of how to structure an object tree when both menus and buttons
are on the screen? I have menus working by themselves...

Question 2: I've encountered fonts ending with .fnt and .fed both being
refered to as GDOS fonts. Which is correct? Is there a difference?

Thanks to all those who answered my earlier queries about monitors for the ST. It looks as though my best best for sharpness and high resolution for less than $1000.00 is to use a 640x400 res mono monitor on my vintage ST. Now I have new questions:

1. Is the Atari monochrome my best option, i.e. is its sharpness as good as I can expect from any monochrome in the <$1000.00 price range?
2. What are some other paper-white monos in the $200.00 - 500.00 range that are better?

Beta Testing

A note to those who offered to beta test my hypertext text editor--please send me a snail mail address so I can mail you some DSDD disks with the program and utilities. I have no FTP or GEnie access, so snail mail is the best option. Reply directly to the header address or try one of the following.

All the hardware registers are still located in the same places. But,
you should not reference them with an extra "ff." The actual locations
are 0x00ff0000 and such, not 0xffff0000. The 68000 itself doesn't care
about the leading ff's, but for the 020/030/+, all 32 address bits are
significant. If you want to guarantee future compatibility, don't use the
leading ff's.
BTW, according to an Atari Explorer (I think...), Atari had to install
special traps in the TT to check for programs that used the extra ff,
to redirect the memory location to the correct place.

This is inaccurate. GEMFED is _really_ old. It predates the official release of GDOS and probably the Line-A document. You can use GDOS fonts _with_ GDOS with documented VDI functions. You can also use bitmapped GDOS fonts without GDOS by adding them to the line-A font ring structure. This is no longer a good idea because many of the line-A functions are going away in the future.

To use GDOS fonts with GDOS, check out

vst_loadfonts
vst_unloadfonts
vst_font
vst_point

I've used these documented VDI functions for GDOS fonts and they work fine.
(My spelling may not be quite correct since I'm typing this from work and away from my VDI manual.)

>peripheral and register addresses on the 20/30s so that we need
>to use 0xfffff000 instead?

Atari has made a concession to programs with incorrectly defined hardware address space so that they still run on the TT. In other words, on the TT 0x00FF8000 is mapped to 0xFFFF8000. I suspect this is a mapping of physical address spaces by whatever GLUE logic the TT uses. Strictly speaking, only the 0xFFFF8000 addresses should be used because the hardware is conceptually at negative addresses. This makes access possible using instructions with short addressing modes and saves time and space in the code. Atari has redefined the hardware addresses so that you MAY use 0x00FF8000 addresses, but there is no natural reason for you to want to use them. It is only provided for braindead compatibility.

Actually it might be the whole top megabyte which is remapped, from 0x00F00000 onto 0xFFF00000. Maybe someone else can fill in more detail.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just finished sending the latest program of the week to the usual places
(atari.archive.umich.edu ftp site and comp.binaries.atari.st moderated news).

DC PopBar our most popular program of the week has been updated!

This is a new version of DC PopBar, the DA that gives you a popup menu of
the GEM desktop menubar. This version is _much_ improved. Download this
and see why this is our #1 most popular desk accessory (now even better!).

ST and STe ONLY. Not for the NewDesk desktop. 1.6x and below. 100% assembly.

- mike vederman / double click software

Jambo netters,

I'd like to get few facts & opinnions on following:

Having a TT030/8 and considering buying a CALAMUS SL (you know 16.4 million col.

-What choices do I have in monitors... I want a big one (at least 19")
-How many coclors do they display ?
-what kind of triks do they do to the TOS ? which of them CAL.SL supports ?
- any hints, tips, or things to avoid ?

-anything that's mental as anything or not will help !!!

THANKS !

Thanks to everyone who replied to my original post.

My original intent of the post was to possibly get some information that would make my brain click (snap is probably a better word) and then it would dawn on me what was wrong with my program. But it wasn't working out that way. So, I continued to put my nose to the grindstone and what I've come up with is that the display of an alert or two is causing the problems. I haven't pinpointed exactly why yet though. My problems are happening on an STe. The program runs fine on a 520ST and a 1040ST.

Are alerts processed differently on an STe (or rather a later version of TOS) than on an ST? Does anyone know of any screwy stuff to look out for with alerts? I saw in the STe addendum to the developer's docs that each line of an alert should be less than 30 characters. Isn't the limit on the earlier STs 40 characters per line? If this were true wouldn't it screw up a lot of developers?

If this is in fact the case, then Atari have royally screwed up. Even if the hardware base is physically located at 0x00FF0000 because of using the old 24-bit GLUE chips, the hardware documentation states that accesses to 0x00FF0000 and 0xFFFF0000 addresses are equivalent. I maintain that there is no sensible reason for using the lower block of hardware addresses, except in older software that didn't know any better. TOS addresses the hardware at 0xFFFF.... as does any code generated by recent compilers.

This may explain the strange behavior of Turbo C. When I wrote my Turbo
16 Startup...YOU DO have MY VERSION don't you, for my Mega STE I noticed
machine code generation for ff produced a 16 bit address instruction,

for example: 0xffff8e20 became -> 8e20...obviously incorrect. However,
0x00ff8e20, produced the correct address.

I hate it when compilers make assumptions, esspecially incorrect ones
about what the programmer wants besides the literal addres he specified,
I don't like this at all.

Naughty naughty Turbo C. But I still love you..smoochy.

Perhaps, but I have always read that ffff and 0fff are suppost to be
the SAME THING like what it says in my TT reference's.

Oh well, --Gregory

Everything I've seen indicates that the buffers are arrays of char.
I just wrote a test program that seemed to verify that.

#include <osbind.h>
#include <stdio.h>
#include <ctype.h>
struct iorec
{
char *buf; /* pointer to an array: char buffer[bufsiz] */
short bufsiz; /* size of the array */
short head; /* index for writing */
short tail; /* index for reading */
short low; /* low water mark, for XON */
short high; /* high water mark, for XOFF */
};

void dumpio(ptr)
register struct iorec *ptr;
{
register short i;
register char *p;
register char c;
p = ptr->buf;

printf("io->bufsiz = %d\n", ptr->bufsiz);
printf("io->head = %d\n", ptr->head);
printf("io->tail = %d\n", ptr->tail);
printf("io->low = %d\n", ptr->low);
printf("io->high = %d\n", ptr->high);

/* now, for the contents... */

printf("io->buf contents:\n");
for (i=0; i < ptr->bufsiz; i++)
{
```

```
c = p[i];
printf("p[%d] = 0x%2.2x; ASCII = %c\n", i, c, (isprint(c) ?
c : ' '));
}
printf("\nEnd of iobuf\n\n");
}

main()
{
struct iorec *bp;
bp = (struct iorec *) Iorec(0);
printf("\nHere is the input record and buffer:\n");
dumpio(bp);
printf("\nHere is the input record and buffer:\n");
bp++;
dumpio(bp);
}
```

-> I need to receive messages when
-> 1. Either mouse button goes up or down
-> 2. A key is pressed
-> 3. A menu selection is made
-> 4. A gadget box is clicked
-> 5. The pointer moves

-> 2, 3, and 4 seem to be no problem. However, AES seems to want me to
->wait for a "particular mouse button state", not wait for changes in
->that state. In other words, it appears to NOT be event-oriented...
->well, it just has a limited idea of what a "mouse event" is.

-> It seems I can get messages continually by waiting for 0 clicks;
->this gives a constant stream of button events and I suppose I could
->generate mouse-move and button-change events myself by tracking
->the previous values of everything, but a real event-driven GUI
->wouldn't require the use to do this. Is this the Right Way,
->knowledgeable folks?

I don't know; but i hope so ;-)
Doing the same (wanting a reply on every possible mouse button event, and
generating up/down events from this info) i spotted a bug? in the AES:
when i send a redraw message to my application, i get it back, but the reply
value of event_multi() signals a mouse button event as well (this is quite
logic, since i always want such an event). But when getting a user-send
message, the mouse status is not up-to-date, just zeros...

(Pseudo) solution: when getting a message say that the mouse-button event is
not valid. Yes, this is a dirty hack (IMHO).

That's not quite true, 0xff...... is mapped to 0x00......
Therefor you can use 0x00 or 0xff but physicaly all the ST-RAM and
Registers are located
at 0x00...... . The only problem is if you want to access 'undocumented'
TT registers wich
are located at 0xffff.... (physikaly). If you wan't to access these
registers (f.e.
the TT-Fastram-Controller registers like the refresh-rate register) you
habe to reprogram
the translation tables. But since these registers aren't documented
nobody should use them
so there should be no problem.

> is a mapping of physical address spaces by whatever GLUE logic the
> TT uses. Strictly speaking, only the 0xFFFF8000 addresses should be
0x00ff8000 should be used if your program run under another o.s. than TOS.
Adress translation is done by the PMMU of the 68030 so it's not done by
the hardware, but
current TOS-Versions (and I think future too) set the translation table
of the PMMU to
map 0xff...... to 0x00...... .

I think a lot of people would be interested in this, so I'm posting
the explanation.

When you call evnt_multi or evnt_mouse, you must tell GEM how many
clicks you are expecting (usually 1 or 2). If you set bit 8 of this
variable (ie. OR in 256), then the condition described in the state
variable, (the one specifying button up/down) is negated.

Sound confusing? Let me give an example. Say you want to know if
either a right or left mouse click occured, and you want to check for
both single and double clicking. Then the variables are:

clicks = 258; {2 for double-click + 256}
button = 3; {Both left & right buttons}
state = 0; {Buttons are up (negated by clicks)}

So what does all this mean? Well, taken literally, it says "Let me
know when the left and right buttons are not both up", or "Let me know
when either the left or right buttons (or both) have been depressed."

I have used this, and it never fails. I can't take all the credit for
it, though. Jan Timm first mailed me this bit of information, so I
extend my thanks for the insight as well.

Hope this helps. If confusion still reigns, let me know and I'll
write up a more detailed post. This is just off the top of my head
(and from a file that I am periodically viewing from UIS III).

Absolutely correct. Use word mode addressing to get at the
I/O address space!

|Actually it might be the whole top megabyte which is remapped, from
|0x00F00000 onto 0xFFF00000. Maybe someone else can fill in more detail.

No. Only $00FFxxxx is physically mapped to $FFFFxxxx, for compatibility
with programs written for the ST which only used 24 bits of address for
things. Losing 64k of address space was considered a reasonable
concession to keep software working.

Please note that *ONLY* a high address word of $00FF is mapped to
$FFFF. The high byte is significant! And as mentioned above,
you shouldn't use $00FFxxxx addresses anyways. Use the more efficient
word addressing when accessing I/O space. Using long word addresses
only wastes time and space.

Source record: 47090

rodent@netcom.COM (Ben Discoe) writes:

| Surprise discovery in the VDIT source doc: GDOS fonts require OFFICIALLY
|UNDOCUMENTED functions. This is incredible! Imagine a graphical operating
|system that doesn't document how to use bitmapped fonts! It staggers the
|imagination.

Appendix J of the VDI manual explains how to program for GDOS, and
includes an example program that shows how to load fonts and find
out what fonts are available. It also describes the format of
bitmapped font files, with a structure that defines the font header.

More GDOS documentation is available on request from developer support,
including information on writing VDI device drivers for specific
output devices.

Atari actually documented something! It staggers the imagination.

| Question 1: can someone recommend a book on GEM that gives gory, full
|explantion of how to structure an object tree when both menus and buttons
|are on the screen? I have menus working by themselves...

I don't know if this is specifically addressed, but the best references
I've seen for GEM (in English :) are the Compute! Books AES and VDI
references. I can only pray that someday someone will translate
Julian's book to English so I can read it! (or maybe I really should
get off my duff and learn to read Deutsch)

| Question 2: I've encountered fonts ending with .fnt and .fed both being
|refered to as GDOS fonts. Which is correct? Is there a difference?

You can call your fonts whatever you want, since they are loaded based
on the entries in the ASSIGN.SYS file. Call 'em *.FOO if you like. ;)
All my GDOS fonts have a .FNT extender, though.

3503. MEGA STE ROMs on MEGA ST

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-23 23:41:15 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991Sep23.234115.27158@informatik.uni-erlangen.de>
Source record: 47089

Hi folks,

I've seen a couple of questions about fitting Mega STE ROMs into a Mega ST.
Here's a description how to add extra ROM space to a Mega, at the same adress
where it's in the STE. It can be used for ROM-Disks or even be booted from.
The TOS2.05 will NOT run with this little hack, because the Mega doesn't have
the STE's hardware. Maybe somebody can patch the 2.05, then I don't see why
it couldn't run on Megas with this hack.

Although Mega and Mega STE have 256K ROM space, the Mega uses only the first 192K,
leaving 64K unused. That's because the top 64K are used for all the I/O
chips. So the OS-ROM was moved from $FC0000 to $E00000 leaving enough
space for expansion. To fit a 256K ROM into a Mega, adress lines A20-A23
must be decoded to generate a chip-select. To make the CPU recognize the
new ROM, a DTACK signal has to be generated, too. The diode (1N4148)
makes the DTACK open collector. The /CS signal goes to the ROM /CS input,
if you use an EPROM, tie /OE and /CS together. On Reset, the Mega will still
boot from the old TOS, however. If it is to boot from the new ROMs at adress
$E00000, remove the old OS-ROMs, and connect their /CS signal (or use GLUE's
select for the lowest ROM) to the boot input, otherwise tie that input high.

The chips are a 74LS00 and 74LS30. They fit on a small circuit board,
and you can get the supply voltage from any TTL chip in the Mega.
All lines (except VCC , /CS and "boot_input") can be soldered to the CPU
directly, or via the connector.

If EPROMS are used instead of the OS-ROM, they don`t fit into the 28 pin
sockets. The pinout is slightly different, too. You might want to use a
32 pin socket (for the EPROM) and plug it into a 28 pin socket and cut the
appropriate pins on the top socket instead of the EPROM (makes programming them
a hassle ;-) then do the rewiring (ROM has an address line on the pin where the
EPROM has a select line). If anyone is interested in this, I can post how
to do this.

That's not true, the standard registers are physicaly located at
0x00FF.... _NOT_ at 0xFFFF.... !!!!!
Under TOS 3.01/3.05 the PMMU is programmed to map all 0xFF..... accesses to
0x00.... .
Here is the PMMU-Table like TOS3.01/3.05 sets it up:

[ Table : Entry ] Log.Addr = Phys.Addr Flags
-----------------------------------------------------
[ 700 : 0000074A] -> Table 00000740 U
[ 740 : 000007CA] -> Table 000007C0 U
[ 7c0 : 00000019] 00000000 = 00000000 U M
[ 7c4 : 00100009] 00100000 = 00100000 U
[ 7c8 : 00200009] 00200000 = 00200000 U
[ 7cc : 00300019] 00300000 = 00300000 U M
[ 7d0 : 00400001] 00400000 = 00400000
[ 7d4 : 00500001] 00500000 = 00500000
[ 7d8 : 00600001] 00600000 = 00600000
[ 7dc : 00700001] 00700000 = 00700000
```

```
[ 7e0 : 00800001] 00800000 = 00800000
[ 7e4 : 00900001] 00900000 = 00900000

[ 78c : 03000041] F3000000 = 03000000 C
[ 790 : 04000041] F4000000 = 04000000 C
[ 794 : 05000041] F5000000 = 05000000 C
[ 798 : 06000041] F6000000 = 06000000 C
[ 79c : 07000041] F7000000 = 07000000 C
[ 7a0 : 08000041] F8000000 = 08000000 C
[ 7a4 : 09000041] F9000000 = 09000000 C
[ 7a8 : 0A000041] FA000000 = 0A000000 C
[ 7ac : 0B000041] FB000000 = 0B000000 C
```

```
[ 7b0 : 0C000041] FC000000 = 0C000000 C
[ 7b4 : 0D000041] FD000000 = 0D000000 C
[ 7b8 : 0E000041] FE000000 = 0E000000 C
[ 7bc : 000007CA] -> Table 000007C0 U
```

Here is the start of logical 0xff adresses, they are _COMPLETLY_ mapped to 0x00.... :

```
[ 7c0 : 00000019] FF000000 = 00000000 U M
[ 7c4 : 00100009] FF100000 = 00100000 U
[ 7c8 : 00200009] FF200000 = 00200000 U
[ 7cc : 00300019] FF300000 = 00300000 U M
[ 7d0 : 00400001] FF400000 = 00400000
[ 7d4 : 00500001] FF500000 = 00500000
[ 7d8 : 00600001] FF600000 = 00600000
[ 7dc : 00700001] FF700000 = 00700000
[ 7e0 : 00800001] FF800000 = 00800000
[ 7e4 : 00900001] FF900000 = 00900000
[ 7e8 : 00A00001] FFA00000 = 00A00000
[ 7ec : 00B00001] FFB00000 = 00B00000
[ 7f0 : 00C00001] FFC00000 = 00C00000
[ 7f4 : 00D00001] FFD00000 = 00D00000
[ 7f8 : 00E00009] FFE00000 = 00E00000 U
[ 7fc : 00F00059] FFF00000 = 00F00000 U M C
```

So what does this means ? Programs running under TOS can use 0x00ff.... or 0xffff.... the PMMU maps all to 0x00ff.... . So it is no problem using short adressing with TOS. BUT if you write an emulator for the TT you have to know that all adresses are located at 0x00...... f.e. if you write a Macintosh emulator and want to use System7 wich uses the PMMU on its own, you _HAVE_ to use _ALWAYS_ 0x00ff.... and not 0xffff.... . Using 0xffff.... will cause the system to crash (you will get buserrors all the time). Perhaps that's one reason why Spectre don't work together with System7 ??

ciao,
Alexander Herzlinger

[...]
>for example: 0xffff8e20 became -> 8e20...obviously incorrect. However,
>0x00ff8e20, produced the correct address.

I think you are wrong here, because :

MOVE.W #$8e20,An == MOVE.L #$FFFF8e20,An

Remember that addresses are sign-extended before put in address registers.
(just like MOVEM.W do with all registers)

Now what is the diffrence between :

ADDQ.W #m,An and ADDQ.L #m,An ???

Grueazi !

I recently downloaded some icon archives with NeoDesk Icons. Now since I don't own NeoDesk yet but like to test the icons, I need to know the format in which these icons (*.NIC) are stored.

If anybody has got an idea or better certain informations please let me know.

Ciao,
Manfred

Are there any Atari 8-bit emulators available for the ST? I'm considering writing one for [the other 68K-based home computer], and I'm interested in any perspectives I might find here. In particular, I'm concerned about ways of emulating the custom chips (display list interrupts, sound, etc.)

As far as I know, there are no Atari emulators for [the other 68K-based home computer], except for gag ST emulators. That's why I came here. I figure those who remained faithful to Atari might have pressed for an 8-bit emulator.

Thanks, peoples.

kbad@atari.UUCP (Ken Badertscher) writes:
>Only $00FFxxxx is physically mapped to $FFFFxxxx,

Actually, that's wrong, Ken. $00xxxxxx and $FFxxxxxx refer to the same address space. Other values in the high 8 bits of the address refer to unique addresses. The reason for this is as Ken mentioned: so programs that use $00FF8240 for palette register zero will work, and so will those that use $8240.w or $FFFF8240. However, programs that use $0FFF8240 won't work: note that there are three F's there, and the high 8 bits of the address are $0F. We have actually seen programs that do this, and they don't work on a TT without 24BIT.

As a side-effect, $FF000008 (for example) refers to the bus error vector, just like $00000008 does, but this is less likely to be useful to anybody.

>variable, (the one specifying button up/down) is negated.

Are you sure about evnt_mouse? I can't get it to work with evnt_mouse,
but it works fine in evnt_multi.
I have used the trick since Claus Brod told about it in this group some
years ago.

I still hope that Atari will document this feature.
-Why? because there is more use for 'either the left or the right botton'
than there is for a 'wait for both botton'.
Did you notice that the TT doc states that the new keyboard supports up
to 3 bottons on the mouse? Gem will then tell you about the following
events :
left, left-middle, left-right, left-middle-right.
If Gem is asked to make events for the left botton. If you set Gem to wait
for all 3 bottons you will only get an event when all 3 bottons are down!

>> Good Reason To Upgrade.
>>

So - that's it! I've been puzzled why CNTRL-C does not work on my
Mega ST-4 when I give it as an input to Cconin() - whereas it DOES work if
I compile the SAME program on my STE (by the way I use MWC version 3.0.6).

However MWC's gets() function seems to respond correctly to CNTRL-C
on the older TOSes whereas my own "gets()" function (which uses Cconin())
does not - but is OK on the STE.

Sorry I missed the begining of this debate - but I would be obliged
if anyone could mail me if they know how to ENABLE CNTRL-C in response to
Cconin() (short of Allen Pratt's sledgehammer solution of upgrading the
TOS - or would he prefer I buy a new Mega STE?)

Sincerely, W. Alan B. Evans

I have access to a surplus VY1000 by Moniterm corp. This monitor
has the small D connector (RBG I believe). I wondered if this monitor
could be hooked up to the ST, as Moniterm builds ST-specific monitors.

I forget the name of it, but there is an 8-bit emulator out there
somewhere. It's pretty good I think.

That's not true. The standard addresses are physically located at BOTH
0x00FF AND 0xFFFF. I think you should probably think twice before
correcting somebody who has "atari" in his return address. It leads to
needless confusion and contradiction.

Yes, the PMMU is used to map addresses, because of a bug in the 68030's
cache-inhibit logic, and yes, the page tables route both $FFxxxxxx and
$00xxxxxx to $00xxxxxx, but that doesn't make you right. It turns out that
it saves page table space, that's all.

Oops! I never realized that. I have used evnt_multi and just assumed
(we all know what happens when you assume) that is worked w/
evnt_mouse as well. But, knowing the quirkiness of the Atari OS and
graphics routines, it doesn't surprise me much :-)

You are right, I am sorry if I confused people, that was not my intention.
I thought more than twice for sure, but did it more than twice wrong.
I don't think that nobody should answer if somebody who has "atari" in his
return adress tells something wrong, we are all human beings and therefor make
errors, so Ken and I did, but now we know how it is exactly :-).
I think that's what this newsgroup is for; to help other people if you think
you can. And that's what I wanted to do.

bye,
Alex

There is an 9-Bit Emulator for the Atari ST called Xformer 2.5. It is
pretty good, but not too fast. I think it was released into the public
domain, but I'm not sure about that so don't quote me. The only time I
saw it was at a User group meeting, and at the time it didn't do sound
(and wasn't version 2.5, so it may do it by now).

There is also a Commodore 64 Emulator, but I haven't seen or used it.

From: feather@vuse.vanderbilt.edu
Message-ID: <1991Sep26.143451.12199@vuse.vanderbilt.edu>
Source record: 46961

I have a 1040st with TOS 1.0 . When I bought the machine, I also bought an external 5.25 (360kb) IB drive for use with PC-ditto 1. It came with software (a driver) to allow it to also be used and formated by TOS. Works great.

Question: Could I replace the 5.25 drive in the external case with a 3.5 DS-DD drive (like drive A) and use the TOS as is... no driver. If so, could I put in (is there a driver for) a 1.2Mb 5.25 ? Or how about a 1.44Mb 3.5 ? I know the limit is the capability of the internal controller in the ST. So, can it be done?

Dave

Hi there,

I need some good advice. I'm looking for a software which fits my needs and
can do the following actions:

- dial the number of a subnet node until the host answers

- my mails which are there should be packed and downloaded

- separated newsgroups should be packed and downloaded

- close the connection

- distribute the downloaded files in the correspondent directories,
unpack them

- show me a protocol what was going on

The software must run on a Atari TT030/6 and a Supra Modem 2400 plus.
I would prefer PD or shareware.

Hello atariens !

A friend and I are programming in Modula2 with the
good old TDI compiler.
We were tired of using the m2desk and he has rewritten
an improved version which will be soon avaliable as freeware
for all TDI users.

Just one thing is missing : we don't know which messages
the m2 accessory is able to respond in order to give
the current configuration of parameters (paths, for compiler
linker, etc) : does someone has theses specs ?

Last thing : is it true that TDI corp doesn't want
to update there (good) compiler ? is it true that they
even doesn't sell it ?

Really last thing : i'm wondering if somewhere someone is still
using this package ... except my friend and I !!

I salute you from France !!!

>supervisor flag, but this tells you nothing; a user program may also
>switch to supervisor mode).

Well, I was told by someone (forgot who, but that's not unusual) that
one could put a routine at the XBIOS, BIOS, BDOS etc interrupts which
could keep account of how many times the OS had been called.
It is ofcourse quite easy to write a routine which increases a counter
for every time the trap was called and then execute the the trap but
the problems then is - How can I detect an exit FROM the OS?

If this new problem could be solved then it wouldn't be so difficult
to implement a MESSYDOS like flag.

In any event, though, it seems to be a hopeless quest, because there
is so many ways user programs could mess this up...

Hmm. Seems as if I've lost some of the previous messages. Could anyone
please tell me some highlights of the SST board?

1) Does it fit into a 'standard' ST520
2) Does it come populated or - if not - in which configuration?
3) Compatible with Mega STe/TT or what?
4) Dhrystones? Whetstones?
5) Price tag?
6) And last: When is it available and where can I buy one?!

Given a low price such a board could really be a big hit!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just purchased an NEC P3200 24-pin printer (New at a local store for $209, $100 less than even the Bay Area) and I need some help.

The printer works just fine, but I use GDOS and Microsoft Write, and the drivers do not support the Graphics Print I would need for different fonts, etc.

The NEC 7710 driver doesn't work.

I have tried setting up my GDOS for an Epson FX printer (which the NEC can emulate) but Graphics Print is a no go, although Meta print to a .GEM file works.

So, using GDOS and Write, is there a driver available so I can use to do graphic printouts?

Also, the print screen driver in the ST doesn't print a decent screen. Any help here too?

3528. question about Megafile 30

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-27 16:17:32 UTC
From: darius@isasun-1.edm.isac.ca
Message-ID: <1991Sep27.161732.14365@edm.isac.CA>
Source record: 46971
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Inside my megafile 30 is a seagate ST238R hard drive; the R means RLL format. Am I correct in assuming, then, that the controller in the megafile is an RLL-to-ACSI board? Does this mean that if I want to swap the drive mech., the only choice I have is to use an RLL drive, or is it possible to use some other type of drive?

Please be patient with me if this question seems stupid. I'm not a hard drive expert, just someone who wants an easy way to get a bigger, faster hard drive.

addqw #1,a0 and addql #1,a0 are different only in execution time (at least in 68010 or above). Therefore, 'addql #k,An' is an unnecessary code. (So is the 'clrl Dn', which should be replaced by a 'moveq #0,Dn').

TDI not doesn't sell their compiler anymore, but they haven't existed for several years. Somebody, I believe, still owns rights to TDI's compiler (ask in the comp.lang.modula2 newsgroup). The last version to come out was 3.00a.

Yes, there are a few other people still using it. I'm one. There must be at least one other, assuming he hasn't sold the ST.

I was under the impression that TDI had completely dropped all support (or maybe even gone out of business). I do have a copy of the TDI Modula-2 compiler, but never really spent too much time with it once it appeared to be a dead end. I also know of at least one person in the local user group here in San Diego that did quite a bit of programming with it. I don't believe he has access to the net, but I will forward your message to him through a local bulletin board and see if he can answer it.

Yes you are right, you can only use a MFM RLL drive, or take a chance
and use a normal MFM drive and format it RLL..

Also it is posible to format hard drives with a 1:1 interleave, but
this has to be forced with some format software, as the controler is
seen as a Adaptec 4070, this normaly can't do 1:1,
but this is a Atari one, and it Can..!

>exists in ATARI AES, this would be a much better solution to the regular
>yield problem inherent in co-operative multitasking than evnt_timer(0).
>
Alas, appl_yield is not in ATARI AES, so you will have to use
evnt_timer. But don't use evnt_timer(0)! Why not? When you want to keep
your programs portable to GEM 3 (on a MSDOS machine), there are some
things you should program differently. E.g. evnt_timer(0) doesn't return
immediately, but will hang forever (in fact, for 2^32 msec, but that is
roughly the same). Use evnt_timer(1) instead (though in some cases, this
will cause an extra delay you can't use :-( )
Also, don't expect mouse click events when you click outside windows
that you own. When you want to register mouse-clicks on the desktop, use
wind_set(WF_NEWDESK, ...), otherwise you won't own the desktop, and will
not get any mouse-clicks made there.

> program was invoked?
Should be the environment on startup of program, but added variables should
be added to this environment, futher is should become the starup environment
for any program that is started by this program.
Just like Unix I would say, but since the ST has an AES which uses an envi-
ronment the AES environment should always be the same as the environment any
program might see.

> -- Is the third (usually ignored) argument to main() commonly
> a pointer to an array of pointers to char (like argv) or a pointer
> to an array of char (as indicated in the dLibs documentation).
The third argument of main is a pointer to the environment and can be used
just like argv (pointer to array of pointers to char)

> -- Are the Turbo C and GCC libraries in accord on the above points?
TurboC is in agreement with previous statements

install the following routine with
vex_butv(vdi_handle,watch_button,&old_routine);

```
watch_button:
move.w #1,BUTTON_CHANGED
btst #1,d0 ; test rigth button
beq.b L2
move.w #1,RIGHTM_DOWN
bra L3
L2: move.w #0,RIGHTM_DOWN
L3: btst #2,d0 ; test left button
beq.b L4
move.w #1,LEFTM_DOWN
bra.b end
L4: move.w #0,LEFTM_DOWN
end: bra old_routine ; call old routine now
rts ; abbit
```

Then the global variables (capital names) will reflect the status of
the mouse buttons (1=down/changed, 0=up/unchanged)

Do not forget to reinstall the original when the program exits

Thus the top 16MB of TT logical address space is an image of the whole 16MB ST
physical address space, even if the bottom 16MB of logical TT address space
is mapped to TT RAM by the PMMU. If this could be guaranteed for the future,
it might even prove useful. Did I hear ST emulator for TT unix?

>As a side-effect, $FF000008 (for example) refers to the bus error vector,
>just like $00000008 does, but this is less likely to be useful to anybody.

If $FF000000 always refers to the ROM reset vector, this would be useful in
a setup which has RAM at $00000000.
What is the official way of determining ROM version information (start address,
version number, build date) anyway?

I posted the full text of your message to our local user group's bulletin board, and received the following reply which I am posting since the sender doesn't have Usenet access ...

Message : 256 [Open] 9-28-91 8:51pm
From : Mike Bergman
To : Doug Shaw (x)
Subject : #246 TDI Modula-2
Sig(s) : 9 (Programmers Only!)

If you could respond for me to USENET I would appreciate it.

To: Jean-Pierre Chevallet
From: Michael Bergman

The problem is not that TDI does not want to update their compiler; the problem is that TDI does not exist! They faded from existance over a year ago and I have been looking all over to find where I may get the source to their GEM library modules. This has been more of a worry to me than the interface (which was okay for its time), because there are several modules which have bugs that need to be corrected (I have reconstructed some of the libraries, but only those that were critical to me).

Regarding your request for information to their desk accessory, while I do not know what messages are passed back and forth, I can tell you that the only information _not_ passed are the paths. The desk accessory sets the PATH environment variable upon startup or it will modify it if you load in a new M2PATH.TXT file. All other items are accessed via the pipeline. You can find the commands by building a desk accessory called M2OPTION.ACC

and wait for a message from M2DESK.PRG and show that message when it comes up, build a dummy program called M2DESK.PRG to simulated the message sending routines, and then update both programs as you get more information. It should take about a week (perhaps less) to determine all of the messages (or 99% of them).

Good luck and I hope to see your program shell soon!

Michael Bergman
San Diego, California

BTW: I have written a desk accessory paint program in TDI Modula-2 that is currently sold commercially. It is called DTPaint.

3540. two questions: GCC layout & GULAM on autoboot.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-30 04:17:40 UTC
From: bcc@Eyring.COM
Message-ID: <1991Sep30.041740.26813@Eyring.COM>
Source record: 46979

What is the correct layout for gcc? I thought I had it set up properly, but when I attempted to recompile the cassette labeling program from atari.archive it seemed to go into a loop on an include file. It did just fine on a simple hello world program, but something is wrong on the complicated stuff. Could someone do an ls -l -R (under gulam) on their gcc directory and e-mail it to me? If there is interest, I could post a summary.

Second question: Is there a way to make gulam autoboot? I am running TOS 1.4 and I tried the obvious -- putting gu.prg in my AUTO directory, with gulam.g in the root. It doesn't work -- I forget if it freezes up, or what, but it wasn't the right thing. Is it possible? Thanks!

Yes. It is called STXformerII, and is available from atari.archive.umich.edu.
It is very complete, and you can build a cable to connect an 810 or 1050 to
your ST. Pretty neat!

My mono monitor is acting up. When there is little "white stuff" on the screen, it starts to fade until almost black. If more stuff is drawn to the screen, it brightens up. This sound familiar to anyone? Any ideas on what could be going bad?

Use the system variable _sysbase to get the address of the rom header. This
header contains all information you need.

3545. A.A. & GNU s/w

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-30 13:11:13 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Sep30141113@ghiggins.hpl.hp.com>
Source record: 46982
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

News on GNU s/w @ A.A.

Firstly:
========
++jrb has released update13 for the GNU suite on A.A. GNU hunters will
find the file update13.zoo (requiring zoo 2.1 for unarchival) in the A.A.
directories:

~ftp/atari/gnustuff/tos/updates & ~ftp/atari/newtitems

++jrb has also indicated the imminent despatch to A.A. of a cart tape of his
collection of GNU s/w. When the tape has been transferred to A.A. and the s/w
made available, there will be a general announcement here (c.s.a.st*).

Secondly:
=========
Ghostscript 2.3 binaries (freshly uploaded) are available on A.A. The filename
is gs23b.zoo and appears in the following A.A. directories:

~ftp/atari/gnustuff/ghscrpt & ~ftp/atari/newitems

3546. Physical sector 0 of hard disks

Newsgroup: comp.sys.atari.st.tech
Date: 1991-09-30 14:34:36 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Sep30.143436.13587@chinet.chi.il.us>
Source record: 46983

Anyone able to tell me about the contents of the lower part of the root sector (physical sector 0; the one that contains the partition table. Not logical sector 0, the boot sector) of a hard disk? I have no trouble finding documentation on the disk size and partition table, and have even found stuff about the drive parameters (all beyond offset 0x100 into the sector). What lives in the part between offset 0 and the disk parameters, though? And what, if any, validity checks are done on this sector?

This request for information is part of my ongoing attempt to get HDX to make an XGM partition on a 600 MB Wren V. My thought is that if I know enough, maybe I can get it to stop claiming that the formatting information is damaged, and partition the disk. As stated earlier, AHDI drives the disk just fine with 4 BGM partitions, but HDX won't partition it, or even reformat it.

You have to use the 'Install Application' feature of TOS 1.4. Gulam
allows you to use GEM, therefore you can't start it from the AUTO folder.

Their are some very good PD and shareware libraries for the TDI-compiler
including source.

PD: SGL-Tools by Mathias Schick
Wilhelmstr. 8
6750 Kaiserslautern
You may get it from the german magazine ST Computer. All AES and VDI libraries
are implemented. You will get also some high level (M2-like) libraries for
dealing with dialogs, events, accessories and windows.

Shareware: MagicLib/Magictools
by Peter Hellinger
Zerzabelshofstr. 41
D-W8500 Nuernberg 30
There are more than 40 modules including source. Flydials, Popup menus,
radio and check buttons are supported.

Georg

>the drive parameters (all beyond offset 0x100 into the sector). What lives
>in the part between offset 0 and the disk parameters, though? And what, if
>any, validity checks are done on this sector?

The lower part of the root sector contains a program the enables the ST/TT
to autoboot from hard disc. This program checks for an executable boot sector
and loads the first one it finds into memory. After that this bootsector code
is executed and loads and executes the hard disc driver, e.g. SHDRIVER.SYS.

>This request for information is part of my ongoing attempt to get HDX to

>it.

I think HDX refuses to partition your hard disc drive not because of the
root sector structure but because it is missing the bad sector list. This
list contains information concerning bad sectors that have been found during
formattting and markbad with HDX. Normally you find this list on physical
sector 1 of your drive. There is a checksum that validates this list. If the
checksum is wrong or the bad sector list is missing HDX refuses to partition
and reports that the drive was formatted with an old HDX version.
The format of the bad sector list is described in the AHDI 3.00 RELEASE NOTES.
I think you have to set up at least a dummy list to get HDX working.

3555. GCR troubles

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-01 11:32:12 UTC
From: get@coax.Central.Sun.COM
Message-ID: <kegn5sINNikk@cronkite.Central.Sun.COM>
Source record: 46990

I've been using the Spectre GCR on my 1 meg 520st with little trouble.
Every now and again it would not read either of my 2dbl floppy drives.
The 15 meg mac partition of my 45 meg hard drive always works great.
As of now the GCR will not read or format either floppy drive a or b.
I run the tester program against the disk and get errors on the mac side
and none on the atari side. Am I missing something????

> Steve saj@chinet.chi.il.us

Well here is some info from the AHDI 3.0 release notes.

Note: never use AHDI 3.0 as it is buged..

Root Sector Data (physical sector #0)

```
Offset
------
hd_siz $1c2
---------------------------------------
p0_fig $1c6
p0_id
p0_st
p0_siz
---------------------------------------
Repeat above list for 3 more partitions
p1 $1d2
---------------------------------------
p2 $1de
---------------------------------------
p3 $1ea
---------------------------------------
bsi_st $1f6
---------------------------------------
bsi_cnt $1fa
---------------------------------------
Reserved $1fe-$200
```

---

hd_siz is 68000 long word of 512 byte sectors

bsi_st is a 68000 long word offset to the bad sector list.

bsi_cnt is a 68000 long word is the size of the bad sector list.

Partition info
---

p?_fig a 1 byte field, bit 0 partition exists
bit 1-6 reserved
bit 7 set =bootable

p?_id a 3 byte field, for partition type
"GEM" = normal partition (<16megs) GEMDOS
"BGM" = big (>16meg) GEMDOS
"XGM" = extended GEMDOS partition.

p?_st a 68000 long word offset of the beginning of the partition
from the beginning of the disk (512) byte sectors.

p?_siz a 68000 long word for partition size (512) byte sectors

Note: XGM is used to get more than the 4 normal partitions..

I hope this helps, but did your write the correct entry for that
drive in the WINCAP file. ?

3557. Drive Select 1 on external drive

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-01 12:31:23 UTC
From: chris@tharr.UUCP
Message-ID: <2696@tharr.UUCP>
Source record: 46897

On my 1040STFM and my Mega-ST, the Drive Select 1 line (pin 6)
is connected to 5V through a 1K resistor (without any other
connections). Is this generally the case? STEs? TTs?

Can I rely on this line being pulled up to 5V?

I want to power a CMOS chip (80uA max) from this line.

It works fine as long as you don't try to run any programs that use GEM
(GEM is not initialised until _after_ the programs in the AUTO directory have
been run).

Source record: 46903

```
hi net world

i'm trying to adapt a program for an ST to work on our TT030. there
is a piece of code which re-maps the keyboard/mouse interrupt and does
some other stuff every time the interrupt occurs. the code, taken from
Megamax example "key.c" goes like this:

Old_kbd_isr=(long)Setexc(70,kbd_isr);

asm{

kbd_isr:
move.l A0,-(A7)

(do other stuff)

pea retrn(PC)
move.w SR,-(A7)
move.l Old_kbd_isr,A0
jsr (A0) ; jmp has also been tried and failed

retrn:
move.l (A7)+,A0
rte
}

this code works fine on the ST but crashes with two bombs (bus error)
after the "jsr (A0)" command on our TT. any ideas?

thanks
vic spicer
```

>-> 1. Either mouse button goes up or down

Ask event_multi to tell you when the button goes up. Then next time you call
event_multi, ask to wait until it goes down. That should be sufficient, since
you can't really get to "mouse up" events in a row.

>-> 5. The pointer moves

event_multi allows you to designate "enter or leave a given rectangle" as an
event. Just set the rectange to the pixel at the mouse position.

I haven't used such techniques, but the should work.

Just how does one "mix vq_mouse events with event_multi calls"?

I am writing a drawing program (esp. one that supports TT)

My main loop waits for events, but then I use vq_mouse (or graf_mkstate)
so that I can have a rubber-band line drawn to the mouse position until the
user clicks the end point.

HOWEVER, that click on the end-point then comes back to me in the event_multi
call!!!!!!!!!!! ARGH!!!! It is driving me insane!!

Is it something to do with wind_update(END_MCTRL)?

I haven't written half event-driven half polled stuff before, so I am probably
missing something obvious.

Sorry to have to post this, email bounced
==========

I just bought a used copy of TDI Modula 2 for my son. He's away at college and he needed it for some courses there. Problem is, the version we got is very old. It was meant to run on floppies. We tried to patch it to run on our hard disk. The best we could do was to put it in a partition of its own and patch the drive ID. It works but is not the best. He can't wait until we can find a better way or he can go back to C. But in answer to your question, yes someone else is using TDI Modula2. But only for about a month so far. If we can't do something about using folders for sources and putting the compiler in a folder sopmeplace else, it won't last long however. Too bad, I was looking forward to learning Modula2 also.

3564. Re: TDI Modula2 News & Questions.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-02 14:48:08 UTC
From: brahm@mpii02000.cs.uni-sb.de
Message-ID: <BRAHM.91Oct2154808@mpii02000.cs.uni-sb.de>
Source record: 46900

Hi there Modula-2-, GEM- and Atari-Freaks !

I saw the discussion about the old TDI Compiler. It's unbelievable,
that there are a few people left working with this "good" old compiler.
I thought everyone is moving to the NeXT (C++, Objective C) and
has given up the fight for Modula-2...

But perhaps there are a few left, who intend to move to another
Modula-2 compiler taking all their GEM-stuff with them ?

We (the developer of the MOGLI-Library) are considering putting all the
developed stuff on an ftp-site for those people who are highly interested
in getting a tested GEM-library including all the sources, plus a MOGLI
Version of the old TDI-Demonstration-Program, plus the great MOGLI
Icon :-). We also want to make this stuff available without getting any
money for it ! Hey that's fair - isn't it ?

Why MOGLI ?

MOGLI fights against the Modula-2 binding-jungle, growing on the
different Modula-2 implementations of the many producers.

Because every compiler builder had its own ideas how to implement
the ATARI-AES, -VDI, -GEMDOS, -XBIOS und -BIOS functions it is nearly
impossible porting a Modula-2 program from one compiler to another.

MOGLI delivers a common Modula-2 GEM interface for the ATARI ST,
adapted to many Modula-2 compiler. For the first time programmers using
the MOGLI-Interface can now port their application software
between all compilers supporting this standard.

Programmers using the GEM Library delivered by their compiler
manufacturer, should port their Modula-2 software to the
MOGLI-Interface. Then they are able to compile their GEM-modules on
other computers (e.g. TT) and compilers.

The MOGLI identifiers differ from those identifiers used in
common C bindings. They are sometimes longer, than the C names.
They can be better understood by programmers doing their first
steps in programming, as well as they are more readable for
superusers. Note, there are no underline characters (`_') in the names
of the library PROCEDUREs.

Versions of this library are currently available for:

- Good old TDI Modula-2 (Version 3.0a).
(We also don't know what happened with TDI)
The only thing, that helps is having the source, right ?

There was a MOGLI shareware version (10 DM), but nobody wanted it...
- LPR Modula-2 (Available via annonymous ftp at many sites).
(In Germany known as the 'PD-Modula-2 compiler')
There was no version available until now.
- Haenisch Modula-2 (Distributed by Schwaab Software, Dortmund - I think).
Never accepted the MOGLI-Standard :-(

MOGLI is included as a 'ready to use library' on the original disks
for those people, who bought one of the following systems:

- SPC Modula-2 (Version 2.01)
(The original selling company doesn't exist anymore)
Really good: The only thing, that rescues is having the source, right ?
- HiSoft FTL Modula-2 (Version 1.18)
(In Germany distributed through Creative Computer Design, Eltville)
- MAMOS Modula-2 (Version 1.4)
(Swiss company: Mammut Soft)

The actual version number is 1.1. There was no time for the developer
(Uwe Brahm, Johannes Schneiders) to do all the needed changes for
the new TOS features on the Atari Mega STE and TT series of computers.

Really bad: There is no English documentation available for MOGLI, as yet.
If there are enough people interested in such a thing, I could write
something or translate the german documentation and put it together
with the sources at a ftp-site.

Are you interested ? Please let me know ! The more people, the better !

Simply send email to:

brahm@posthorn.informatik.uni-kl.de

I will post a message, if the full MOGLI-Sources are available via ftp.

Any comments ?

Greetings from Germany

Uwe Brahm (Co-Developer of the MOGLI-Interface)
"I have to improve my English !"

> rte
>}

>this code works fine on the ST but crashes with two bombs (bus error)
>after the "jsr (A0)" command on our TT. any ideas?

It seems obvious to me, but I may be wrong:

The code is attempting to make the stack look like an interrupt is occurring
so that when Old_kbd_isr reaches its "rte", control will return to "retrn".

My guess is, the 68030 has a different stack when an exception occurs.

Try this, it seems much cleaner...

Old_kbd_isr=(long)Setexc(70,kbd_isr);

asm{

kbd_isr:
move.l A0,-(A7)

```
(do other stuff)

move.l (A7)+,A0

move.l Old_kbd_isr,-(A7)
rts ; ie. jmp.l (a7)+
}
```

The problem being solved is how to get "jmp Old_kbd_isr".

Hell, I'm no 680x0 guru, maybe there is such and addressing mode for jmp!

3568. re: autobooting Gulam under TOS 1.4 (how it works)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-03 03:11:11 UTC
From: bcc@Eyring.COM
Message-ID: <1991Oct3.031111.819@Eyring.COM>
Source record: 46907

Much appreciation to all those who emailed me the correct answer to my question of how to autoboot gulam under TOS 1.4. Guess I misplaced my TOS manual <grin.> As you all noted, one simply clicks on GU.PRG, then pulls down the 'install application' menu and marks the program as an autobooting utility. Then, if all goes well, the program runs automatically after GEM initializes. Someone pointed out that GU can run from the /AUTO directory; the problem comes in running GEM programs from gulam. I rely heavily on uniterm, so I needed that capability.

The additional complication in my case came from my rather ignorant usage of super boot to dictate which /AUTO programs and which accessories were loaded at boot. Superboot also takes over the autobooting GEM programs from TOS, so that the normal method of installing them as an autobooting gem application does not work. Instead, I found that I have to run the super-boot construction set -- and voila! I can set up as many as 30 auto-booting programs; my choice by pressing the function keys. Now I can choose at boot time to go to gulam, or PDOS, or PC-DITTO II, or Word Perfect, or Uniterm, -- I'm in hog heaven! Gordon Moore, my registration check is in the mail, and I apologise for not doing it sooner. Superboot is great!

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st.tech

I don't know if this will reach you, or what other discussion may have already taken place -- Portal's news software and feed have been wacked out for a couple of days -- so if you see this on a non-Portal site, pop a reply to me in e-mail...

Anyway -- I, too, have long considered writing an Atari 8-bit emulator for "the other 68K-based home computer," but am realistic enough to admit that it will probably be many years or decades beforeI accomplish this feat, if I ever do.

I do, however, have some thoughts on how I'd go about it.

I'd start by emulating a raw 6502 CPU, without any particular supporting hardware. Of course I'd have some jacket code that initialized the 6502 environment, then went into "6502 emulation mode."

Then I'd be able to implement commercial-product-specific emulations as a series of external "environment" files, loadable by the jacket code just before entering 6502 emulation mode. One file would bring up an Atari 800-series environment; another a C= 64; another an Apple IIe, etc. As far as the 6502 is concerned, after all, it just executes instructions and accesses memory. The "environment" files would be responsible for mapping memory references into custom-chip emulation registers etc.

All you would need to do in the enviornment files would be to emulate, or provide for the emulation of, each environmment's complement of custom chips. I'd handle this by having the CPU emulation's memory-referencing code look at a table, part of the loaded environment file, that identified every address in 6502-accessible memory as being RAM, ROM, such-and-such custom chip, banked, etc. etc... (Some research would have to be done to nail down a comprehensive set of identifiers.) If I decided on sixteen different types of "memory" references, that could be represented in four bits per location, making half a byte per 6502 "memory location," or 32K to map a 64K stock Atari 800. That's a pittance on the 68K system of which we speak, and could be multiplied by several powers-of-two without even burping. Then, any time the 6502 CPU "referenced a memory location," the emulation code would look up the memory "type," and vector to the appropriate RAM, ROM, or custom-chip memory-reference emulator.

Each custom chip could be implemented as a dispatcher which decoded the function of the chip register being accessed, and vectored to appropriate code. Each custom-chip emulation would maintain its own internal database -- and could even be implemented as a separate multiprocessing "task," on the 68K system of which we're speaking.

It starts to sound so EASY now that I write it down! :-)

3571. Malloc'ing, what strategy to use?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-03 08:34:21 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1991Oct3.083421.19077@daimi.aau.dk>
Source record: 46906

I'm currently working on a small scale shell, using sozobon C. I need to allocate some space for a little history-buffer, that is 10 strings of 80 characters. Using GEMDOS Malloc I could either allocate 10 blocks of 80 bytes, or I could allocate 1 block of 800 bytes.

If I use the first scheme, I could be able to fill out holes in memory. If a had left a little block of say 100 bytes, I could utilize it. It shouldn't create any extra fragmentation, since the blocks are allocated one after another and freed upon program exit.

On the other side my (ancient) docs to dlibs states (about dlib malloc) that only 16 heaps can be active at one time, due to a GEMDOS bug.

Any comments, anybody?

Christian Lynbech

>}

>this code works fine on the ST but crashes with two bombs (bus error)
>after the "jsr (A0)" command on our TT. any ideas?
```

The code above disregards the stack frame format. Exceptions on the 68030
use stack frames the are different from the 68000. For each exception the
68030 pushes a format word onto the stack which is used by RTE to determine
how many parameters have been saved during exception processing.
I have no literature at the moment but I think the stack frames look like this:

```
status register
return address
format word describing the stack frame
```

You have to save all this information to return to the main program by RTE.
Correct me if I'm wrong.

> problem or (even better) have a solution?
>

yeah, this is a well known problem with many of Megamax's
tools: they were only designed to run in their own environment. True,
that some of their standalone stuff does run outside the environment,
but not without problems (for example they make it impossible to do
file re-directions, they use some funkyness in their enviroment
representaion etc).
the simple solution is to use any of the other makes (about
half a dozen have appeared over the years). someone did post a
modified startup module too once that eased some of the problems, but
i did'nt pay attention as i had already dumped megamax by then.

>provide for the emulation of, each environmment's complement of custom chips.

This sounds like a reasonable approach, but realize that the custom chips are going to be very hard to emulate at full-speed (if you can do it at all). Consider the chip in the Atari 800 that reads the "display list" and updates the screen accordingly; you would have to "emulate" this chip at every single ST horizontal blank interrupt, and the emulation is not trivial. (Remember that the 800 had text modes, with different sizes of text. You could mix and match text on the screen arbitrarily using the display list. Many games were written to exploit the hardware text modes because changing a character's image data would cause all occurrances of that character on the screen to change immediately, just like changing a palette register on the ST causes all pixels of that color to change immeditately. Whereas the ST has only hardware palette animation, the 8-bit had hardware character animation too.)

I assume the way you describe is the way Darek has done Xformer, particularly since he has emulators for other 6502-based machines as well. An alternative approach, however, might be to try and translate 6502 code to 68000 code all at once, and then run the generated 68000 code. This would be faster (probably fast enough for full-speed emulation on an 8Mhz ST, but that's just speculation), but is LOTS harder, because you have to make sure you don't misread data as code and convert it. I think that solving this problem in general is impossible, but perhaps with clever heuristics it would work for enough 8-bit programs to make it useful.

Just a thought.

But we're talking about an Amiga here (at least I think that is "the
other 68K computer, geez) and the Amiga has something similar to a
display list; the Atari display list could possibly be translated into
an Amiga equivalent for custom graphics manipulation.

>interrupt, and the emulation is not trivial. (Remember that the
>800 had text modes, with different sizes of text. You could mix
>and match text on the screen arbitrarily using the display list.

The mixing of text and graphics could easily be handled in the routines to
translate the Atari display into the Amiga (or any other computer) display.
It would be pretty easy to check and see what type of graphics are supposed
to be displayed in that display list line and update the screen accordingly.

>Many games were written to exploit the hardware text modes because
>changing a character's image data would cause all occurrances of

The character animation would be a little more difficult, but you
might be able to accomplish it by redrawing the whole screen every
time the character set is changed. However, this might not fit in
well to the abstraction of the custom chips.

You know, the custom chips for the Amiga were done by the guy who did
the custom chips on the Atari 8-bits. In fact, I think the Amiga is
more like the 8-bits than the ST's. The ST, in fact, are closer to
the Commodore 64. So I don't see what this "other 68K computer" stuff

is about. Unless it refers to the ST's. In any case, I think it's pretty silly.

Lee

Now what about interfacing a ST with a 65c02? (Sorta like the IIe card
for the MAC LC)

Use that 65c02 for the processing power and emulate all the special
chips (GTIA, ANTIC, POKEY,...) in software. Then it would be easy to do
Apple IIe and C-64 without having to worry about emulating the 65c02.

For the Apple IIe, couple it with some GCR disk drive hardware, and then
you can read/write Prodos disks.

(BTW, in Spectre GCR, how much hardware is involved to R/W mac disks?)

3579. ZOOSHELL 0.6

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-03 20:06:40 UTC
From: steve@thelake.mn.org
Message-ID: <A2027165507@thelake.mn.org>
Source record: 46913
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently shipped ZOOSHELL 0.6 off to atari.archive.umich.edu, and (naturally) a bug surfaced quite quickly. The bug is fairly obvious in the code, which also is available at a.a., so if you have Sozobon C and want to fix it, change the following in main():

```
strcpy(zoottp,p);
```

to

```
if (p != NULL)
strcpy(zoottp,p);
```

This bug surfaces only if ZOOSHELL can't find ZOO.TTP in the current directory or with a PATH search. If you use an environment-setting utility (which I wholeheartedly recommend for Desktop users) you'll never encounter this one.

I intend to release a newer version of ZOOSHELL, but at the moment I'm bogged down in the process of writing ARGV-compatible startup and process-control code so that ZOOSHELL can pass very long arguments to ZOO. (I also am doomed to work for a living, which interferes with recreational pursuits.)

Mixing AES and VDI reading of the same mouse clicks can be infinitely frustrating. I solved a problem related to this one by putting in a timer event on a fairly short wait into the event_multi(), and checking the mouse state in the extended line-A variable that contains it. A somewhat more difficult, but more portable approach would to install a mouse interrupt handler which sends messages to your application when necessary, and wait for the messages.

3581. GEMDOS File Functions and the STe

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-04 02:06:35 UTC
From: mlake@irscscm.UUCP
Message-ID: <1991Oct4.020635.17397@irscscm.UUCP>
Source record: 46933

Is anyone aware of any undocumented changes with GEMDOS file functions on an STe from that on an ST? I'm thinking specifically of Fopen. I know there is a limit of the number of files that can be open at the same time. Is there possibly a limit as to the number of Fopens that can be executed in one program? I'd like to hear about anything at all dealing with GEMDOS file functions that could have possibly changed with the STe.

Thanks.

From: seimet@rhrk.uni-kl.de
Message-ID: <1991Oct4.090935.20819@rhrk.uni-kl.de>
Source record: 46919

Why is it impossible to write the last _physical_ page of TT ram on hard disc?
If you try to do that the SCSI controller reports a bus error and the hard
disc driver aborts the operation. This error occurs when the last four bytes
of TT ram are refereced. Is there some kind of prefetch mechanism that leads
to this bus error?
I want to make clear that this is not a bus error exception (2 bombs) that
is handled by the 68030. The error is reflected in the SCSI controller's
status register and does not concern the processor in any way.
Those writing virtual memory management programs must have found this problem.
(So Atari must be aware of it, too???!!!). Can you avoid this bus error or
is it some kind of hardware bug?
I posted a similar article a few months ago but got not a single response.
Maybe in the meantime there are more TT users (I hope so :-)).

3583. GCR Disk problems PLEASE HELP.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-04 09:19:00 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Oct4.091900.15093@newcastle.ac.uk>
Source record: 46695

I have just obtained a GCR but am having trouble trying to get it to read disks formatted on a Mac. I managed to install a system 6.0.4 from the disks but MS word would not copy of the floppy reporting the disk damaged.

I ran GCRTEST.PRG to investigate further.

I first ran a complete test on a blank disk. Which went without a hitch. The next step in my investigation was to do a read test on the faulty disks. This showed a few bad sectors mainly in the 8sec/track column on the Word disk and to my supprise the system disks as well. (I assume the programs just wern't stored on this part of this part of the disk.) I also tried the same test on my external floppy but recieved more errors than before.

In an attempt to solve the problem I first tried adjusting the pot in the GCR but this only seemed to make matters worse.

So assuming the problem was shielding I tried wrapping the internal floppy ribbon cable, power cable and drive in some Aluminium Foil. This again did not make any differance.

Attacking the proble from another angle I tried to format a blank disk on a real mac and transfer the Word program to this new disk. When this disk was tried on the GCR it gave even more errors than the original. (Both disks read fine on a number of Macs). Could the increase in errors (which now start at the 10sec/track column) be attibuted to the mac using a HD drive?

Finally the last thing I could think of trying was to format the disk with the GCR and transfer the software to this disk on the mac. You gessed it lots of errors again.

Summary of methods tried with/without foil wrapping and with adjustments of the pot in the GCR.

Comlete test (Format/write/read etc.) All checks out ok
Read Test (Original Disks.) A few errors on 8/track column
Read Test (Copyed by mac & mac fmnt) Errors from 10/track column
Read Test (Copyed by mac & gcr frmt) Errors from 10/track column

To eliminate the mac from the problem hunting I tried two of them in the above tests with no apreciable differance in the results.

I am after any hints on this as I think the GCR is a great piece of kit but not being able to read original mac disks is a real pain.

I hope someone can help

Dave.

3585. Serious NEODESK bug

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-04 12:07:58 UTC
From: jgj@ssd.csd.harris.com
Message-ID: <JGJ.91Oct4070758@rcx1.ssd.csd.harris.com>
Source record: 46921

I believe I have been bit bad by a bug in neodesk v3.02b (I think thats the right numbers & letters). It seams that when neodesk formats a floppy, it botches the fats & root directory causing the former to spew lots of tiny tiny bits all over the latter when the disk approaches full. Look at it with a old pd tool I have, the fat seams to be 3 sectores instead of 5 like they are on OK disks. I now have a box full of disks with trash for a root directory instead of the backup I made just before repartitioning my disk. I am not a happy camper.

Has anyone else seen this? What are the odds of salvaging a few irreplacable files off this disk? I know they are there (I think) and they sould all occupy contiguous sectors -- this was a backup onto a clean disk after all.

Thanx in advance

>is connected to 5V through a 1K resistor (without any other
>connections). Is this generally the case? STEs? TTs?

This is absolutely normal, and a hang over from the first 520 ST models.
By using this simple but annoying trick, it was possible to use the same
external floppy drive as either drive A: or B: without needing to open
the box and move the jumper.

Since later models have an internal floppy drive and standard Atari external
floppy drives are configured to DS0, I don't expect this to have changed.

>Can I rely on this line being pulled up to 5V?

On your own machine, yes (even if this requires you to change it yourself).
For other people's machines you can never know. It is DS1 on my ST because
that's the way I wanted it.

There are two earth wires in the connector. For your own equipment you could
even modify the connections so one of these can deliver several mA, but you
should take care not to introduce noise in the signal wires.

0x0D is a return, '\r'.
0x0A is a linefeed, '\n'.

Ordinarily, text files on the ST are stored with line enders
consisting of both bytes, 0x0D and 0x0A, in that order. Unix systems
store only the linefeed.

I don't know how Laser C is set up, but if a file is opened in text
mode, it's normal to convert "Line\n" to "Line\r\n" when writing to
disk, and perform the reverse conversion when reading. In other
words, the 0x0D bytes will never appear in lines read using fgets.

If you open the output file in binary mode, 0x0D will not be added to
line enders.

If you're decoding the files on your ST, either format is acceptable.
UUD.TTP and UUCODER are all compiled using C libraries that handle
any necessary translation.

> only 16 heaps can be active at one time, due to a GEMDOS bug.

Use the library functions and malloc.h, and don't worry about memory
fragmentation. Here's why:

Malloc is a GEMDOS function (osbind.h); the C library functions are malloc
(with a lower-case m), lalloc, realloc, calloc, etc.

When dLibs was written, GEMDOS Malloc had a number of restrictions. I
don't know whether they exist in new TOS, but if you want your program to
run safely on all STs, use the C library.

The library routines work around the bugs by calling Malloc a maximum of
16 times to obtain large chunks of memory. They then allocate and free
within those chunks (called heaps in the dlibs documentation) as
necessary. If you ask for a block of memory that is bigger than the
largest available from malloc, then malloc will call Malloc to get more.

The whole point of the dlibs malloc routine is to shield you from the TOS
limitations.

3593. Re: Serious NEODESK bug

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-05 18:40:32 UTC
From: jgj@ssd.csd.harris.com
Message-ID: <JGJ.91Oct5134032@hcx2.ssd.csd.harris.com>
Source record: 46931

I've debugged the problem further and determined the problem was actually
in the backup program, Diamond. The new version of neodesk uses a slightly
different format than "standard." This format as 3 sector fats instead of
5 sector ones. This evidently gives you 4 more sectores (2K) of space on
your disk. Diamond, to avoid the inefficiencies of opening hundreds of files,
writes the disk image directly. It creates 5 sector fats, but doesn't
rewrite sector 0. By modifying the sector with a sector editor (the byte
is at offset 0x16), changing a byte from 0x3 to 0x5, I resurrected all my disks.
Now I know to always format using twister or some other program instead.

The original poster said he was writing a shell. Your solution might
not be so desirable since the large chunk of memory Malloc'ed by the
library routines would not be available to programs running under the
shell.

>or I could allocate 1 block of 800 bytes.

If you know how much space you want in advance, then just declare a
static variable in your program, e.g.,

```
static char history[10][80];
```

Otherwise, you are probably better off allocating 1 block of 800 bytes
for several reasons:

1. Older versions of TOS have bugs that you alluded to that tend to
limit the number of times Malloc can be called.

2. Even under TOS 1.4, each Malloc takes some space from static
system memory to record information about the block allocated. Thus,
your second alternative results in more total storage being used.

3. Fragmentation is generally not a problem under TOS anyway unless
you are doing unusual things.

3599. Running programs from accessories....

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-06 23:07:04 UTC
From: rjwalsh@unix2.tcd.ie
Message-ID: <rjwalsh.686790424@unix2.tcd.ie>
Source record: 46938

I have just started messing about writing desktop accessories, and one
of the first things I tried was to use pexec() to run genst.prg from an
accessory (no particular reason for picking Genst - it was just a test...). And
it worked! I was able to freely switch between the desktop, or what ever program
I happened to be running at the time, and Genst. Unfortunately the menu bar
stayed as Genst's menu bar and I couldn't use the desktops' menu bar. Should
this have worked or was it just a fluke that Genst (version 1.25 - I think)
happened to be a nice GEM program that didn't mess around with the OS? Is there
any way of switching back to the desktops' menu bar? Because I am back at
college now I can't do any further testing of this (my ST is at home.. sigh).
If I set Genst assembling something fairly long, and then switched to the
desktop, should it continue running in the backround? Will the original
accessory still keep running? If so, I should be able to start up a new copy of
Genst to do something else... Maybe a shell would be viable?

s there someone on this globe that can help me out with YAHDFP (Yet another High Density Floppy Problem)?
I bought a conversion kit consisting of four DIL chips which I shall list: SN74LS55N, T74LS393B1, 733WOO131 (or 7718), SN74HC00N.
I bought these at Atin electronics in Leiden The Netherlands who provide no service and show no willingness to help whatsoever (so all you dutchmen: don't buy anything of them).
This kit apparently works fine on a Ye-data drive (type number unknown) but not quite with my Chinon fx-357. I cannot get hold of data sheets for these drives, but maybe someone else can. If so please tell me what the difference is between these two drives!
Apparently the aforementioned kit and drive are German. So please any Germans familiar with these problems try to help me before I am forced to spend large amounts of money.

3601. HOWTO format single partitions on a harddisk ???

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-07 09:18:36 UTC
From: dick@ccsds.ahold.nl
Message-ID: <2920@ahds.ahold.nl>
Source record: 46847

Hello all,

On my harddisk I had some atari stuff (drive C), while on
drives (read: partitions) D, E and F I had Minix.
When Minix creates it's filesystems, it erases the Atari
data on it (I don't know what it all is, but I think it's
things like FAT, #bytes left/occupied).
Since I/m the lucky owner of a Megafile 44, I bought another
disk for it, since both the Atari and Minix space got filled up.
So, I formatted the new disk and copied all the Minix stuff to
the new disk, thus having 44Mb all Minix.
Now the problem:
I now want to reuse partitions D, E and F of the old disk for
Atari stuff again, but BLAST!! - I can't use it, since Minix
erased all the information that TOS needs from it.

Since I think it must be possible to format individual partitions
(even DOS can do that), I wonder HOW ???
Is there some program hanging around which can deal with that ?

HELP ME PLEASE!!! (otherwise I need to re-format the whole thing
again, which needs backing up 20Mb on floppies (aarghhh).

Dick.

> The original poster said he was writing a shell. Your solution might
> not be so desirable since the large chunk of memory Malloc'ed by the
> library routines would not be available to programs running under the
> shell.

If this is a serious problem, then it would be good to consider that
many of the library routines also call malloc and family. Buffered
file i/o is one thing to watch for. A little work with grep and the
dlibs sources will produce a list of the functions that use dynamic
memory directly. There are quite a few.

With dlibs, it's going to be difficult to write a serious program that
doesn't dynamically allocate memory at some point. (This is a point worth
noting if you're writing a desk accessory, too.)

Fortunately, it's not hard to adjust the heap granularity. The malloc
family refers to an external variable _BLKSIZ. This variable is in its own
library module. The module looks like this:

```
/* Default _BLKSIZ variable declaration
*
* NOTE: (16 * _BLKSIZ) is the maximum amount of memory that can
* by managed by the dynamic memory management routines.
*/

long _BLKSIZ = 65536; /* Malloc() in 64K chunks */
```

As you can see, any use of the malloc family is going to produce a
GEMDOS Malloc call for 64K of memory.

To adjust this, you simply compile your own module (or put a global
_BLKSIZ variable in your program).

This will result in the library blksiz.o module not being linked, and the
malloc routines will call for smaller memory blocks from which to parcel
out requested memory.

The code as posted by Steve works. You might want to make sure you have
your modem set so that it raises and drops the carrier detect line and
doesn't leave it high all the time.

> Steve Yelvington, Marine on St. Croix, Minnesota
> steve@thelake.mn.org (In winter we walk on water)

Well, as Michael Fischer has guessed, the reason for Mallocing directly was to use as little memmory as possible. This project started of bitter need because I only have 1 Meg of memory, and then a shell like Gulam is to big (when running emacs and LaTeX), and the small shells of atari.archive are to limited to run some of the unix-style-software like ls. Especially they lack wildcard expansion. I now of Allan Pratts ms-shell (distributed with metafont I think) which is a small shell, but apart from originally having problems with compiling it, I decided to try to write one myself as an exercise.

I know of the _BLKSIZ parameter, but for the reasons above, 64K is to big, and I thought that setting it to something like 100 bytes would be too little, especially with the remark of the max. 16 active heaps. I am running tos 1.4, so perhaps it really isn't a problem.

I also know that other functions are using dlibs-malloc, but it is my plan to substitute these with some of my own. Currently I think the only such function is strdup, which is easily replaced. I'm not using any stdio, so I think I'm having a chance.

The reason why I can't allocate it static, is that I want to be able to adjust the size of the history-buffer on the fly, even though this may be luxury for a shell that is supposed to be small. But I'm greedy. I want it all: history-buffer, environment, alias'es AND lots of memory for big programs.

Note, the 3 sector Fat is standard for Neodesk and some other PD formaters,
You only need 3 sectors to hold the Fat, the 5 sector Fat was a Atari hick up..

What TOS are you using. ?

There is a Program , don't know the name at present
that runs as a TSR that will check for disk full problems, it was brought out by the CodeHead Team, but is PD..Sentinel or some thing like that..

I have a 1040STF. Until recently I used an external modulator to give a colour picture on my Sony TV. Then the modulator box broke.

However, I now have a VCR with composite video input via a SCART connector.

Looking at the pinouts for the ST's monitor port, I believe that there are both TTL RGB outputs and a 1v p/p 75ohm composite video output, plus separate horizontal and vertical sync signals. The video wants 1v p/p 75ohm composite video in, so I thought I was in luck...

I bought an ST -> SCART connector, but connecting the ST to the video didn't give me a picture (it synced on something, but no video. Audio was fine.)

Investigating the connector, I discovered that the composite video pin at the ST end wasn't wired up to anything.

I then looked in the tech. ref. book again, and noticed that it said "Pin 2 -- composite video (where appropriate)". I have a nasty feeling I know what "where appropriate" means...

So, folks, please tell me:

1. Does an ST without an internal UHF modulator produce a composite video output, or does it only produce RGB? (i.e. How much of the video circuitry is missing on an STF?)

2. Anyone know which pin of the SCART should be wired to composite video out on the ST?

3. Do I need to do anything sneaky, like generating a combined sync from the separate H and V syncs?

I have an SM124 for mono (= serious stuff), I'm just looking for a way of getting colour out of my machine so I can play games. If I can't get composite video from my STF, I'm left with four choices:

1. Buy another modulator box or repair the one I've got.

2. Sell my 1040 STF and 520 STFM, and use the money to buy (say) a 1040 STE. (The STFM only has a SS disk drive and 512K, so it's sub-optimal for playing games... and the last thing I need is this extra computer cluttering up the place...)

3. Buy a new (Sony or Mitsubishi) TV with RGB inputs (comments?)

4. Stop playing Lemmings.

Number 4 is clearly unreasonable, so I'm hoping someone on the net can advise on the best course of action... Replies by mail, please.

>on an STe from that on an ST? I'm thinking specifically of Fopen.

Nothing changed. TOS 1.4 and TOS 1.62 (STe TOS) have the same GEMDOS, save for the fix to the bug that POOLFIX fixes -- that bug was in TOS 1.4 and TOS 1.06 but not TOS 1.62. Differences in behavior can come from running or not running FOLDRxxx.PRG; differences in speed from running or not running CACHExxx.PRG, but a given configuration of these two programs should run identically whether you're running TOS 1.4 plus POOLFIX or TOS 1.62.

r0mill01@ULKYVX.BITNET (Robert Delius Royar) writes:

>It's also safer to Malloc in chunks divisible (no remainder) by 512 bytes.

Where did this come from? There is NOTHING in ANY piece of code that cares how much you Malloc, as long as it's more than zero bytes. Your request gets rounded up to an even number of bytes (currently; this may become "multiple of four bytes" in the future), but that's it.

On the subject of Malloc in general: I like what somebody (Steve Yelvington?) described about Dlibs. He says Dlibs does a Malloc(-1L) early on, and uses that number divided by 16 as the "chunk" size for requests from the OS. I *hope* that it doesn't prevent you from allocating more than 16 chunks of that size: with appropriate fragmentation (or TT RAM!) you can have many more than 16 times that much memory available in the system. But the flexible nature of this chunk size (small on a 1040, large on a 4MB machine) is A Good Thing. TOSes 1.4 and newer don't have "number of Mallocs" restrictions, but this algorithm is still worthwhile.

>after the "jsr (A0)" command on our TT. any ideas?

Use JMP not JSR, and you need to test the word at $59e, a system variable
called "longframe." From the 68010 on there is a longer exception stack
frame, and that's what you're constructing by putting the SR and a return
PC onto the stack and jumping to an exception handler. If the word at $59e
is nonzero, you need to push a zero before the "pea" instruction. (On
ST's, $59e is an unused word in system variable space, so it's zero. On
newer TOSes, it gets initialized to a nonzero value if you're on anything
other than a 68000.)

On the other hand, since you're not doing anything useful at retrn, you can
restructure this in a stack-frame-insensitive way:

move.l a0,-(a7)
(do stuff)
move.l (a7)+,a0
move.l Old_kbd_isr,-(a7)
rts

The "move an address from memory to the stack, then rts" trick is a way to
do an indirect jump without changing any registers. Think of it as "jmp to
the address found at Old_kbd_isr" and not really an "rts" and you'll have
the idea. Since the routine you jmp to ends with RTE, and you haven't
changed the exception stack frame, you don't have to care about longframe.
```

3616. An idea for archiver authors (hopefully new & fresh)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-08 21:25:50 UTC
From: DE7B@br1.hrz.th-darmstadt.de
Message-ID: <1991Oct08.212550.22228@infoserver.th-darmstadt.de>
Source record: 46852

```
An idea for archiver writers:

How about enabling the user to give the program a file that
just contains possible file extensions and specifying
what compression scheme ought to be used (none/default f.i.)

That could look like this:

default: .c .y .txt .doc .ps .dup # and so on
none: .arc .zoo .lzh .app .Z \ # you could call compressed
.pc? # programs APPs f.i.
[Actually default wouldn't be needed, but for programs trying
various algorithms, it would be helpful to specify "crunch:"]

How many files do you have that end in .c [on any system] that
don't contain mostly ASCII ? How many .zoo files are there that
do ?

I think such a scheme would be extremeley helpful when arcing up
directory trees f.e. , that contain archives themselves. It's pretty
annoying to wait for half an hour to see an archiver grind through
an already compressed file, if the program makes it at all.

Nat!
```

3617. HELP!! Disk drive troubles

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-09 00:06:22 UTC
From: km456265@longs.LANCE.ColoState.Edu
Message-ID: <18276@ccncsu.ColoState.EDU>
Source record: 46853

Sender:
Reply-To: km456265@longs.LANCE.ColoState.Edu (Kevin Melsheimer)
Followup-To:
Distribution:
Organization: Colorado State University, Fort Collins, CO 80523
Keywords: floppy drive problems

I am in desperate need of help. Today while using my atari 520st
I put my favorite game I played the day before in the disk drive,
turned on the computer and had three bombs appear on my screen.
Ithought to myself, well the disk just went bad, oh well. So I
tried another, to find a set of four bombs(cold boot). Great
another bad disk I thought to myself. So I put in another and
another and another. Well, you get the picture. I eventually
came to the conclusion that my disk drive was broke (after all it
has a lot of time on it). So I took my single sided drive out of
the closet and tried to boot up again--no luck. I thought to
myself, maybe its the contacts, so I sprayed the connectors with
ith some contact cleaner and tried again...still nothing. Then
I remembered that the chips sometimes needed to be reseated, so
I undid the atari and unseated and reseated the chips closest
to the drive connector. This time the machine did boot up and
didn't give me the usual assortment of 3 and 4 bombs along with
the occassional 2 bombs. The drive actually read a disk. This
may have been due to just finding a disk that would work or it
could have been that what I did fixed it. But it wasn't fixed
Now I can only read about 10% of my disks.

I thought that this might be due to alignment problems but I
don't think that it would affect both drives. Could it be the
controller chip? If so which chip needs replacement, how can I
get one and how much. If it is alignment, how can I test for
this and correct it?

Any help in this matter is much aprreciated,
Thankyou
Kevin Melsheimer

You can't do that!

you must renembr all the good programming rules from atari. An accessory
can't malloc memory after his initialsiation. Pexec() do a malloc so Pexec is
forbieden in accessorys.

Source record: 46857

Hi, I have a broken 520 st with a memory mod by Zubair interfaces, the
ez-ram II which was installed by the board maker Zubair. After
the system was moved it stopped working.

After numerous phone attempts to have my calls returned,
I have hooked up the box to a logic analyzer and now need
a rom listing to figure out where the bus fault occurs.

Many thanks if anyone can supply me with this.

I have to say I'm a little shocked that it ran, but it does seem possible. I think there are a lot of logical reasons why it a shell might not be 100% feasible, but this is how I understand the German product MultiGEM works. <Can someone elaborate on that product?>

> accessory still keep running? If so, I should be able to start up a new copy of
> Genst to do something else... Maybe a shell would be viable?

I kind of like the integrated environment of GENST2.PRG now, but I have to admit that running it as a DA might be nice for some special cases. Would be interesting idea to play with....

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have some text files and some postscript files I need to send to a printer to print. They are large and the postscript contains some complicated (like any postscript isn't) routines. If the printer has to do too much processing of the postscript, it pauses the data transfer. If the pause is too long, the computer just gives up trying to send the data to the printer. Help, what can I do? The printer could be connected to the serial port, is that my solution? Is there some piece of software which is smaret enough to poll the printer port and ignore the machines port isn't working status, or.....?

Machine is 4 Meg STe.

> from the OS.

Actually, no, I didn't say that -- near as I can tell from reading Dale's
code, dlibs never changes _BLKSIZ. The code *will* allocate more than
16 * _BLKSIZ if you ask for more than _BLKSIZ memory at once, but if you
want to malloc 88 bazillion little line buffers on a big-memory TT, you'll
run into a library limitation unless you do something to change _BLKSIZ.

The simplest place to implement the algorithm Allan describes is in
dstart.s. I have NOT tested the following code, but I see no reason why
it couldn't be done like so:

******************
.bss
.globl __BLKSIZ ; add this to the declarations
.comm __BLKSIZ,4 ; at the top of dstart.s

*******************
.text ;
; add this just above the
; ``jsr __main'' line in dstart.s
;
;
move.l #-1,-(sp) ; push -1L
move.w #72,-(sp) ; function 72 (Malloc)
jsr _gemdos ; call GEMDOS
asr.l #4,d0 ; shift right to divide by 16
move.l d0,__BLKSIZ ; and put the result into _BLKSIZ
;
; now you can jsr to the __main library
; module, which initializes stdio.
;

Note: I still can't write asm worth a hoot. Sozobon translated this
from C for me.

I think you mean that a cariage return is inserted but never mind that.

TOS as MSDOS uses the convention of \r\n as textline ending
whereas UNIX (SUN) uses \n as line ending

Cure don't capture uudecode files but send them in binary mode using
some protocol (in that case you can decode them at the unix side before
transfer). Or use a decode program (UUD.TTP) that doesn't care about
whether the text
is in DOS style or UNIX style

With the DC AtariFest just a couple of days away, I'm trying to decide
how to put myself in the poor house and was wondering if
I could cram say a T16 accelerator *AND* PC-Speed (or any two similar
products) inside my Mega ST. Has anyone out there done this?
I assume I'd have to stack one on top of the other as they both plug into
the 68000's socket and provide a pass thru. Is there enough clearance?
Will the work together?

P.S. I know that the T16 won't make PC-Speed any faster, but are they
compatible?

Hey, it's not that worse. Each time malloc() is called, the routines
check if you want more than _BLKSIZE KByte of Memory. If yes, the routines
will call Malloc() with that size.
If you ant less than _BLKSIZE, the routines check if they have Malloc()'ed
enough space before. If yes, they'll give back a adresss in that previously
Malloc()'ed area. If not, they'll do a new Malloc().

Just one example how it look like in real life:

[Start of programm]

In the C-Source System call
malloc (10) Malloc (BLKSIZE) returning address A
malloc (30000) none, lib returns a+10
malloc (30000) none, lib returns a+30010
malloc (10000) Malloc (BLKSIZE) returning address B
malloc (500) none, lib returns a+60510
malloc (100K) Malloc (100K)

Now you'll see what's happening: The libraries request memory in chucks of
64 MByte and give that memory to the programm when it needs memory. If
the programm needs more memory than the libs have left internally, they'll
request a new chunck from OS. If the programm wants more than BLKSIZE,
the libs pass this request to Malloc()....

Well, what they neglected to tell you is that the rules change with
such things as:

1) Barametric Pressure differential between here and Europe.
2) The average per second failure of an Atari dealership nowhere near you.
3) The impending doom everybody knows about, but refuses to recognize.

Gather these three things and the programming practice of the day, is
very very clear.

I've been using ARJ on my PC lately. It has a nifty feature I'd really appreciate on my ST: It can segment archives to whatever size you like, and write them directly to floppies. It knows standard floppy sizes like "360" without you having to get it right down to the byte.

I really like TURTLE, but I'd rather have something that compresses on-the-fly.

Is this really correct. Are there really no legal means of getting more memory or
spawn a program. Would it be bad if I started up a program from an accessory
and kept control until the program had finished and thus released its memory?

What is the problem anyway?

Hey, yah, I've got several RAMDisk accessories that would Malloc() at any point
after booting... SI_RAM for example can install a RAMdisk and spooler of
whatever size you specify, and then uninstall them if you want. Does this mean
that if I try that in a program, my ST'll puke?

3639. 3.5" floppy ribbon cable

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-11 15:59:52 UTC
From: fsctc@lercuts.lerc.nasa.gov
Message-ID: <1991Oct11.155952.8701@eagle.lerc.nasa.gov>
Source record: 46879

Okay, guys. I have a really stupid question. Let's see if anyone can set me straight. On the 34-pin ribbon cable that goes to the ST's floppy, the wires are numbered from 1 to 34 consecutively, starting with the wire that has the red stripe, right?

The reason that I'm asking this is because I'm not sure whether the instruction that I got for making the connection of an external floppy to my ST is correct. The instruction says all ODD lines in the ribbon cable are to be grounded, while most of the signals are in the even lines. Well, I made the connection and found out that all of the EVEN lines on the floppy drive are grounded, not the ODD lines. Yes, I checked to make sure I plugged the header in the correct way. All of the pins are now connected to each other. So, is the cable wiring numbering something like 2-1-4-3 ... or should the EVEN lines on the ribbon cable be connected? Do I sound confused?

Secondly, is there a file that detail how to hook up an external 3.5" floppy to the ST's 14-pin DIN plug?

Dr. Tsuji, are you still monitoring this SIG? I haven't been able to get through to you.

Clarence

There are ways for a desk accessory to use GEMDOS resources. You just have to understand where and why to be careful. Here's a very unofficial description distilled from public sources. I'm not a developer, and I hope that if there are errors below, a definitive source can correct them.

Desk Accessories aren't legal citizens of GEMDOS. They're aliens whose presence is unrecognized. They aren't allowed to own property in the GEMDOS realm, such as memory and file handles.

They may occasionally transact GEMDOS business. But the Desk Accessory has to be careful not to get caught. If it can pick up a tool, use it, and put it down before anybody notices, there's no problem. GEMDOS ``thinks'' that a real citizen -- the current Application -- is doing the work.

Big trouble can arise if an Application terminates, leaving a Desk Accessory holding something it doesn't own.

How can that happen? Keep in mind that the AES Event Manager is a gross, ``cooperative'' multitasker. It lets an Application and several Desk Accessories voluntarily pass control back and forth.

GEMDOS is blind to the whole process. If a DA opens a file and then calls on the Event Manager for input, the Application may regain control and terminate. GEMDOS may then assign the resources to another Application. Big trouble ensues.

You can still perform file access from a DA, however.

Example: You're writing a Desk Accessory that sends files in the background via Xmodem/Ymodem.

You Fopen a file, Fread a block, make note of your position in that file, and then Fclose it. Format the block and dump it out the serial port (which has its own buffer), then call the Event Manager. Other programs can run while the data crawls out the modem, one bit at a time.

When you're awakened by the Event Manager, Fopen the file, Fseek to your position, Fread the next block, Fclose.

In this manner, you're never caught holding a GEMDOS tool when a task switch takes place.

Dynamic memory allocation can work the same way. You can Malloc, quickly use, and Free memory. More useful, though, is the technique of dynamically allocating memory from your own private static buffer. GNOME, a Desk Accessory version of MicroEMACS, uses this technique and does not call Malloc.

(Since a Desk Accessory is loaded and started by the Desktop, and since the Desktop never terminates, it may be possible for a DA to Malloc memory in that context. I presume that's how a configurable RAMdisk might be implemented as an .ACC. I have not tried it.)

I believe the restrictions on Pexec are more severe than the restrictions on file and memory usage. The most recent semiofficial advice I've seen is a flat ``don't ever call Pexec from a Desk Accessory.'' Charles F. Johnson of Codehead Software suggested recently on GEnie that you can write your own routines to load a program into memory, perform any necessary address reference fixups, and start it. However, I have to wonder how GEMDOS handles a Pterm or Pterm0 in that context. It might be necessary to intercept that call.

I wouldn't assume that they're calling Malloc. I believe that I remember some discussion of this issue from a couple of years ago, and one solution involved stealing memory from the system by fiddling with the _memtop system variable (at 0x436).

However, I don't know whether that's legal. The Abacus documentation for Ssbrk (xbios function 0x01) says that it reserves memory at the top of RAM, which leads me to think that it must adjust _memtop. The Abacus documentation also says that Ssbrk ``must be called before initializing the operating system,'' i.e., from boot ROM, which would make it useless.

The Abacus books are often wrong. Perhaps someone who knows the truth can discuss the issue.

3641. StyleWriter

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-11 23:10:33 UTC
From: ens@ccu.umanitoba.ca
Message-ID: <1991Oct11.231033.28009@ccu.umanitoba.ca>
Source record: 46876

I bought a Canon BubbleJet recently and it is nice and fast
for ASCII files using resident fonts. However, while it has nice quality
with PageStream, it is impractical for this purpose because of the speed:
12 minutes for one page. This is frustrating because the Apple StyleWriter
(same price) can print the same quality from a Mac Plus in 2 minutes,
presumably because it uses data compression. Furthermore, I have not
yet found a driver to use the bubbleJet in MAC mode with a GCR. I think
I might have been better to buy a StyleWriter bu that raises the question:

Has anyone tried to write an ST driver (GDOS or other) for the Apple
StyleWriter. Such a thing should provide much faster graphics printing in ST
mode (if one could use the compression), and could be used directly
in MAC mode (also at faster speed). The only thing you lose is printing
ASCII files with resident fonts... which is OK for me.

Almost any V.32 is good for using with ST. And they all have MNP error
correction. You could look for one that has V.42/V.42bis protocols
too. And you should check which protocols do the modems at the
University support.
ST's serial port is limited to 19200bps, so you cant get the full
efficiency of V.42bis, but it is still alot faster than MNP 5. MNP 5
is slow because it takes time to do the compressing/uncompressing.
V.42 does this much faster.
My recommendation is to look for Anchor 96 E 5. It has many
capabilities that even USRobotics can only dream about and it is still
quite affordable priced. And German Atarians think it is good...

The Atari ST modem programming guide
October 12, 1991

Copyright 1991 Steve Yelvington
Internet: <steve@thelake.mn.org>
GEnie: S.YELVINGTO2

Introduction

Modem i/o on the ST is isn't difficult. In fact, compared with other personal systems, the ST is unusually easy to program for serial communications.

The hard work is done for you. TOS includes interrupt-driven serial port routines. This means that when a character arrives at the serial port, TOS breaks away from whatever it's doing, grabs the character, stores it in a buffer, and returns to the task that was interrupted. You don't need to write code to do that.

The serial port buffers -- one for input, one for output -- are FIFO (First In, First Out) queues. TOS provides functions for reading from the input buffer, writing to the output buffer, and even changing the size of the buffers.

All you have to do is read from or write to the serial port as if it were a console.

This document contains examples in C. If you're programming in another language, don't despair, because C is used here only to string together TOS functions. The strategies don't change when you shift to another system of notation.

The modem i/o routines

Both BIOS and GEMDOS provide functions for single-character serial i/o that work exactly like their console equivalents.

>From GEMDOS:

```
Console Serial Description
------- ------ -----------
Cconin Read a character with echo
Cnecin Cauxin Read a character without echo
Cconout Cauxout Write a character
Cconis Cauxis Return TRUE if a character is available
Cconos Cauxos Return TRUE if output is possible, i.e.,
the output buffer has room for more data
```

There is not a serial port equivalent for Cconws, but you should be able to write one easily enough:

```
#include <osbind.h>
void Cauxws(s) /* write a nul-terminated string to the aux port */
register char *s;
{
register char c;
while (c=*s++)
Cauxout(c);
}
```

In C, GEMDOS functions usually are implemented as preprocessor macros that translate into gemdos() function calls. Other languages may require that you write GEMDOS calls explicitly. If you're coding in assembler, you should be able to translate the following by keeping in mind that you push the arguments onto the stack from right to left and then call trap #1 for gemdos.

Here are common C preprocessor definitions for the above-mentioned operations (plus a few more).

```
#define Cconin() (long) gemdos(0x1)
#define Cconout(a) (void) gemdos(0x2,(short)(a))
#define Cauxin() (short) gemdos(0x3)
#define Cauxout(a) (void) gemdos(0x4,(short)(a))
#define Cprnout(a) (void) gemdos(0x5,(short)(a))
#define Cnecin() (long) gemdos(0x8)
#define Crawio(a) (long) gemdos(0x6,(short)(a))
#define Crawcin() (long) gemdos(0x7)
#define Cconws(a) (void) gemdos(0x9,(char*)(a))
#define Cconrs(a) (void) gemdos(0x0a,(char*)(a))
#define Cconis() (short) gemdos(0x0b)
#define Cconos() (short) gemdos(0x10)
#define Cprnos() (short) gemdos(0x11)
#define Cauxis() (short) gemdos(0x12)
#define Cauxos() (short) gemdos(0x13)
```

What about BIOS?

>From BIOS, the approach is slightly different. BIOS provides one function for each operation, with the device indicated by an argument. The first argument to the function is the device number:

```
Console Serial Description
------- ------ -----------
Bconin(2) Bconin(1) Read a character
Bconout(2,c) Bconout(1,c) Write a character c
Bconstat(2) Bconstat(1) Return TRUE if a character is available
Bcostat(2) Bcostat(1) Return TRUE if output is possible

Note that the device numbers used by the BIOS are different from the
file handles used at the GEMDOS level. The BIOS device numbers may be
defined in this fashion:

#define BCON_PRT 0 /* printer */
#define BCON_AUX 1 /* aux (modem) port */
#define BCON_CON 2 /* console */
#define BCON_MIDI 3 /* MIDI port */
#define BCON_KBD 4 /* intelligent keyboard device output */
#define BCON_RAW 5 /* raw console output, no VT52 */

The BIOS macros are defined as follows:

#define Bconstat(dev) bios(1,(short)(dev))
#define Bconin(dev) bios(2,(short)(dev))
#define Bconout(dev,ch) bios(3,(short)(dev),(short)(ch))
#define Bcostat(dev) bios(8,(short)(dev))

If you're using assembly language, the bios trap is #13.

There is a no function to read a string from the serial port at
either the GEMDOS level or the BIOS level. For reasons that will
become clear shortly, you should write your own.

All of the GEMDOS and BIOS input functions return 32-bit LONG values.

In the case of the serial port, only the low 8 bits are interesting.

In the case of the console, the low 8 bits will contain the
ASCII code corresponding to the key -- if there is one. If the
keystroke is a nonstandard key, such as a function key, HELP or
UNDO, the low eight bits will be an ASCII nul value. In all
cases, the upper 24 bits contain a unique keyscan code and
information regarding the state of the shift keys.

A simple terminal program
-------------------------

A ``dumb'' terminal program using these functions is simple to write.
All you need is a loop in which you will ``poll'' the console and the
serial port. It might look like this:

#include <osbind.h>
#define BANNER "\033EIncredibly dumb full-duplex terminal version 0.1\r\n"

main()
{
int c;
```

```
Cconws(BANNER);
for(;;)
{
if (Cauxstat()) /* data waiting at the aux port */
{
c = (int) (Cauxin() & 0xFF); /* get it and clean it */
Cconout(c);
}
if (Cconstat()) /* data waiting at the console */
{
c = (int) (Cnecin() & 0xFF); /* get it and clean it */
if (c) /* if it's not a NUL from a function key */
Cauxout(c);
}
}
}
```

You'll notice that the above example runs forever. Well, not quite. GEMDOS console i/o processes control-characters, and a control-C will kill the program.

Of course, that means you can't send control-C out the modem port. That's one of many reasons it's called an ``incredibly dumb'' terminal.

You'll probably want to rewrite the program using BIOS functions and test for use of the UNDO or F10 keys.

Whatever happened to GEM?

None of this discussion has dealt with GEM. Why? Because so far as GEM is concerned, the serial port doesn't exist.

The AES Event Manager doesn't poll the aux port to determine whether an event has occurred.

If you want to write a GEM event-driven communications program that will cooperate with desk accessories for multitasking, you'll need to use the timer with a time value of 0. This will allow a task switch to take place, and when you regain control you can check the serial port's status with GEMDOS or BIOS.

If you're worried that the serial input buffer will overflow while some system-hog task is running, resize the buffer as described below.

The real world intrudes

None of the above functions cares whether the modem is live or dead. They only deal with data. If your caller falls asleep at the keyboard or abruptly hangs up, the above functions won't worry about a thing.

If you're writing a communications program or a BBS, you'll have to deal with these real-world conditions. Modems and phone lines are not perfect.

There are many ways to handle such errors. In C, you might want to use the setjmp and longjmp functions to ``bail out'' and restart your program. Assuming you have set up a jump buffer called ``panic,'' you might write a low-level aux port input function that looks like this:

```
#include <time.h>
#include <osbind.h>
#define TIMEOUT 60 /* 60-second timeout */

int auxin()
{
clock_t time1,elapsed;
if (!rs232cd())
{
hangup();
longjmp(panic);
}
time1 = clock(); /* get tick time */

/* loop for up to TIMEOUT seconds, waiting for aux input */
for(;;)
{
if (Cauxis()) /* these could just as well be BIOS calls */
return Cauxin();

/* no activity yet, so ... */
/* get new tick time and convert to seconds */

elapsed = (clock() - time1) / CLK_TCK;

/* if too much time has elapsed, restart */

if (elapsed > TIMEOUT)
{
hangup();
longjmp(panic);
}
} /* continue the loop */
}
```

The above code has used a couple of functions that aren't in the library and bear some explaining. Here is the function that checks the carrier-detect status of the aux port by examining a hardware register:

```
#include <osbind.h>
int rs232cd() /* state of rs232 carrier detect line */
{
register long ssp;
```

```
register int *mfp, status;
mfp = ((int *) 0xFFFFFA00L); /* base address of MFP */
ssp = Super(0L); /* enter supervisor mode */
status = *mfp; /* get MFP status */
Super(ssp); /* return to user mode */
return(!(status & 0x0002)); /* check for carrier */
}
```

Here is a function that hangs up the phone line by dropping the DTR (Data Terminal Ready) signal. Note that most modems are shipped from the factory with DTR sensitivity disabled. You should be able to turn it back on by toggling a DIP switch or with a command from the keyboard.

```
#include <osbind.h>
void hangup()
{
Ongibit(0x10); /* dtr off */
sleep(1); /* wait one second */
Offgibit(0xEF); /* dtr on */
}
```

Now, what about getting a string from the modem port? You'll need to call your custom auxin() function, as above. Here is an auxgets function modified from the dLibs getln. Note that it uses a function ``auxput'' for output; you can rewrite or #define it to mirror the BIOS or GEMDOS-level routine you used for input:

```
#define KEY_CR 0x0D /* carriage return */
#define KEY_LF 0x0A /* linefeed */
#define KEY_BS 0x08 /* backspace */
#define KEY_DEL 0x7F /* delete */

char *auxgets(buffer, limit)
char *buffer; /* where keystrokes will be stored */
register int limit; /* size of the buffer */
{
register char *bp = buffer;
register int c, i = 0;
for(;;)
{
c = auxin() & 0xFF; /* mask off high bits, just in case */

/* end of line */
if((c == KEY_CR) || (c == KEY_LF))
{
*bp = '\0';
break;
}

/* backspace or delete */
else if(((c == KEY_BS) || (c == KEY_DEL)) && (bp != buffer))
```

```
{
--bp;
auxput('\b');
auxput(' ');
auxput('\b');
--i;
}
else if((c >= ' ') && (i < limit))
{
auxput(*bp++ = c);
++i;
}
}
return(buffer);
}
```

Configuring the serial port

In order to communicate with another machine over the serial port, speed and flow-control settings may need to be altered. Atari's XBIOS (Extended BIOS) provides a function that can configure the serial port. The function Rsconf sets the speed, flow-control and four bitmapped hardware registers.

Speed (bits per second, often incorrectly called baud) can be set to any of 16 values:

```
#define BPS_19200 0 /* standard */
#define BPS_9600 1 /* standard */
#define BPS_4800 2 /* standard */
#define BPS_3600 3
#define BPS_2400 4 /* standard */
#define BPS_2000 5
#define BPS_1800 6
#define BPS_1200 7 /* standard */
#define BPS_600 8
#define BPS_300 9 /* standard */
#define BPS_200 10
#define BPS_150 11
#define BPS_134 12
#define BPS_110 13
#define BPS_75 14
#define BPS_50 15
```

Only the values marked /* standard */ are commonly used in modem communications.

If you are using a slow- or medium-speed modem (under 9600bps) you probably will need to match the ST's serial port speed to that of the remote system.

If you are using a high-speed modem, you may be able to set the speed at 19,200bps and let the modem handle speed-matching chores. In this case, you probably will need to use RTS/CTS (hardware) flow-control to avoid overloading the ST's input buffer and the modem's output buffer. RTS/CTS is broken in most versions of TOS, and an /auto/ folder program must be installed to fix it.

Flow control can be configured to any of four settings:

```
#define FLOW_NONE 0 /* default */
#define FLOW_XONXOFF 1 /* control-s, control-q software */
#define FLOW_RTSCTS 2 /* hardware */
#define FLOW_BOTH 3 /* both hardware and software */
```

For binary file transfers, software flow control must not be used.

The hardware registers are not useful in ordinary modem-related programming, and altering their values incorrectly will have unpleasant side effects. Passing -1 to Rsconf will leave the corresponding setting unchanged.

Thus, to set bps rate to 2400 and flow control to none, the Rsconf function call would look like this:

```
Rsconf(BPS_1200,FLOW_NONE,-1,-1,-1,-1)
```

Parity and duplex

Parity is not commonly used in communicating with personal computers, but you may need to deal with it when communicating with a mainframe.

The idea behind parity is to provide at least a small degree of assurance that the transmitted character is the same as the received character. The way this is done is by fiddling with the high bit of each byte, which ordinarily would be zero for an ASCII character.

``Even parity'' means that the high bit is either set or unset, as necessary, to ensure that the result is an even number. ``Odd parity'' means the opposite. You can test this with the modulus operator in C, then strip the high bit by ANDing the byte with 0x7F or set the high bit by ANDing with 0xFF.

TOS also can generate parity values automatically if the proper hardware register is set. However, setting the register requires that you also worry about start/stop bits, word length and the serial hardware frequency, which is a can of worms.

Duplex is a potentially confusing term that describes whether you or a remote system is responsible for putting a character on your screen.

Most bulletin board systems run ``full duplex,'' which means that a keystroke from a caller is sent to the BBS, which then echoes that character back to the caller. This relationship is not symmetrical.

The caller doesn't echo anything back to the BBS, because the echoes would be interpreted as commands.

``Half duplex'' means that each party is responsible for managing his or her own display. GEnie normally runs half duplex. Neither caller nor BBS echoes anything.

If you're writing a BBS or a terminal program with a ``chat mode,'' you may want to include a ``both local and remote echo'' option. This would allow the remote to run full duplex while you manage both your screen and the caller's screen.

Resizing the serial buffers

When a character arrives at the serial port, TOS interrupts what it's doing, grabs the character before it disappears, and records it in an input buffer. When your program wishes to write to the serial port, TOS buffers the output so that your program can proceed with other chores without having to wait for a slow modem to transmit the data.

TOS provides those buffers, but TOS also provides a facility for changing them. Why would you want to do so? Here's a scenario:

You're using Xmodem and you have a slow floppy drive. Xmodem ACKS a block, then proceeds to write it to disk while the sender sends the next block. So far, so good. But if you switch to Ymodem's 1K blocks and a very fast modem, the TOS default buffer might overflow while you're writing the previous block to that slow floppy drive. Solution: Use a bigger input buffer.

Another scenario: You're running a BBS. The caller is reading a long message and decides it's boring. The caller pushes the cancel key (control-C, or S, or whatever you've decided makes sense.) The BBS stops sending, but that big output buffer is full of data -- and it just keeps coming, and coming .... Solution: Use small i/o buffers for interacting with humans.

TOS provides an XBIOS function that returns a pointer to an input buffer record. It requires one argument: The BIOS number of a device (see above).

```
#define Iorec(dev) (void*) xbios(14, (short)(dev))
```

Assembly programmers: The xbios trap is #14, so push the device number followed by two 14's, then do the trap. The pointer will be found in d0.

The iorec structure is defined as follows:

```
struct iorec
{
char *buf; /* pointer to an array: char buffer[bufsiz] */
```

```
short bufsiz; /* size of the array */
short head; /* index for writing */
short tail; /* index for reading */
short low; /* low water mark, for XON */
short high; /* high water mark, for XOFF */
}
```

For the AUX port, the output buffer record immediately follows the input buffer record.

Before you go poking around inside these records, keep in mind that they are internal to TOS, and they are shared by all processes that run on your system. You can change the buffers and even bypass GEMDOS and BIOS for reading and writing, if you so desire, but you must be prepared to live with the consequences.

In particular, be very careful to restore the original record when your program terminates (unless you're writing a TSR with the express purpose of enlarging a buffer).

Immediately after the serial port's input and output records are some internal TOS variables that may be useful. The following code has worked on all versions of TOS that I've encountered. I don't know whether Atari guarantees that the variables won't be changed on future versions of TOS.

With those cautions in mind, here is some code, originally lifted from an early ST communications program written by Dale Schumacher. I've been using the open_aux and close_aux functions for years, but I haven't had a need to deal with the rsr, tsr, and flow control variables.

```
typedef struct
{
struct iorec in; /* 0 Input buffer record */
struct iorec out; /* 14 Output buffer record */
char rsr_status; /* 28 MFP(0x1C) Receiver status */
char tsr_status; /* 29 MFP(0x1D) Transmit status */
char xoff_sent; /* 30 TRUE if we sent XOFF */
char xoff_received; /* 31 TRUE if we got XOFF */
char mode; /* 32 Bit 0 XON, Bit 1 RTS mode */
char filler; /* 33 Unused */
} IOREC;

#define IBUFSIZ 1200
#define OBUFSIZ 2

char st_ibuf[IBUFSIZ]; /* our own input buffer */
char st_obuf[OBUFSIZ]; /* and our own output buffer */

IOREC *st_sysr; /* ptr to system rs232 record */
IOREC st_savr; /* to save system rs232 record */
```

```
IOREC st_myiorec =
{
/* first, an input record */
st_ibuf, IBUFSIZ, 0, 0, (IBUFSIZ/4), (3*(IBUFSIZ/4)),

/* then an output record */
st_obuf, OBUFSIZ, 0, 0, 0, 1,

/* and the rsr, tsr, flow control stuff */
0, 0, 0, 0, 0, 0
};

void openaux() /* set up our own rs232 input and output buffers */
{
while(Bconstat(AUX)) /* flush existing buffer */
Bconin(AUX);
st_sysr = (IOREC *)Iorec(0);
st_savr = *st_sysr; /* Save system buffer */
*st_sysr = st_myiorec; /* Set my io buffer */
}

void closeaux() /* restore system i/o buffer */
{
*st_sysr = st_savr;
}
```

Take a break

Some remote systems, notably Unix sites, need a BREAK signal to wake them up and help them synchronize with a caller's bps rate. To generate a BREAK on the ST, you briefly toggle the transmit status register. Here is code that does so by directly accessing the hardware on the ST. I think Dale Schumacher is the author of this code.

```
#include <time.h>
#include <osbind.h>

void nap(n) /* do nothing for n-100ths of a second */
register int n;
{
register clock_t t, dt;
dt = (CLK_TCK * ((clock_t) n)) / ((clock_t) 100);
t = clock() + dt;
while(clock() < t)
;
}

void snd_brk() /* send a BREAK to the rs232 port */
{
register long ssp;
register char *tsr;
tsr = ((char *) 0xFFFFFA2DL); /* address of tsr */
```

```
ssp = (long) Super(0L); /* enter supervisor mode */
*tsr = 0x09; /* turn break on */
Super(ssp); /* return to user mode */
nap(30); /* 0.3 second BREAK */
ssp = (long) Super(0L); /* enter supervisor mode */
*tsr = 0x01; /* turn break off */
Super(ssp); /* return to user mode */
}
```

The clock() function should be available with most C compilers. If you're writing in a language that doesn't have an equivalent, the trick is simply to peek at memory location 4BA (hex), which is the 200Hz system timer. You must be in supervisor mode to do so. The value is a 32-bit long.

File transfers

When transferring a binary file, the sender and the receiver have to agree on a method for signalling the end of the transmission. Ideally, they should have some method of determining whether the file was mangled by line noise. And if it was, there should be a way to retransmit the bad data.

The methods for solving these problems are called file-transfer protocols, and their name should be legion, for they are many. Xmodem, Ymodem, Zmodem, Quick B, WXmodem, Kermit, Punter, FAST, Telink, UUCP 'G' ... the list goes on.

Most of them follow the same basic strategy. A file is broken up into multiple packets. Each packet starts with a header that includes a packet number and a mathematical value, called a checksum, that can be used to determine whether the data in the packet has been corrupted.

XMODEM is a very simple implementation of this strategy.

It uses 128-byte data packets. It uses packet headers consisting of a a byte for the packet number, and (in the original version) a byte for a checksum. The checksum is calculated by adding the numeric value of each byte and throwing away the overflow. It's not foolproof, but it detects most errors.

Later versions of Xmodem use a 16-bit ``cyclical redundancy check'' calculated by using a fairly complex algorithm. It's much harder to fool.

If the Xmodem receiver adds up all the values and finds they don't match the total that was encoded in the packet header, it sends a NAK (Negative AcKnowledgement) signal to the sender, which then retransmits the corrupted packet. If they match, it the receiver sends an ACK.

Because the packages are small, and because the sender always waits for an ACK before proceeding, Xmodem is not particularly fast. When XMODEM runs over a network that does its own error-checking and packet operations internally (such as CompuServe or GEnie's data systems), Xmodem can get painfully slow. That lonely ACK signal can take a long time to wander through the network and get back to you.

There are two ways of dealing with Xmodem's speed problems. One is to use bigger packets, which is the approach taken by most alternatives, including Ymodem. The other is to use ``windowing,'' which is used by WXmodem, UUCP 'G' and Zmodem.

A windowing protocol doesn't wait for an ACK before sending. Instead, it transmits the next block. If a NAK arrives, it can back up and resend the bad block. The number of blocks that can be ``remembered'' is the size of the ``window.'' A sliding-window implementation is one in which the sender's window moves along as you move through the file and get ACKs from the receiver.

And now, the code.

This document isn't going to attempt to present a C implementation of a file-transfer protocol. But the question of ``how do I calculate a checksum'' comes up frequently, here is C code to create the values used by Xmodem, Ymodem and some related programs.

Some CRC functions index the CRC values out of an array of precalculated numbers. That approach probably is faster than the one below, but the ST has plenty of horsepower for this sort of thing.

Don't ask me to explain the math. I can't. I didn't write this; I just use it.

```
/*
* This function calculates the CRC used by the XMODEM/CRC
* Protocol.
* The first argument is a pointer to the message block.
* The second argument is the number of bytes in the message block.
* The function returns a short integer that contains the CRC value.
*/
short crc16(ptr, count)
register char *ptr;
register short count;
{
register short crc = 0, i;
while(--count >= 0)
{
crc = crc ^ (short)*ptr++ << 8;
for(i=0; i<8; ++i)
```

```
{
if(crc & 0x8000)
crc = crc << 1 ^ 0x1021;
else
crc = crc << 1;
}
}
return(crc & 0xFFFF);
}
```

If you want to port this to another language, keep in mind that

a << b evaluates to the bit pattern of a shifted left b bits

* dereferences a pointer; *ptr++ evaluates to the pointed-to value and then increments ptr by the size of the pointed-to value

^ is a bitwise exclusive OR operator; 11110000 (binary) ^ 00001111 evaluates to 11111111

& in the context above is a bitwise AND operator; crc & 0xFFFF basically strips anything above 16 bits (important if your environment supports 32-bit ints).

Yes there is a GREAT mac emulator. (SE) made by a company called Gadgets by Small, will run about 450 with 128k Mac roms. about 90% compatable also, will read/write mac disks..

(303) 791-6098 call and they will be happy to send you info or maybe the latest newsletter..

OK, I've got a question.

> RTS/CTS is broken in most versions of TOS, and an /auto/
>folder program must be installed to fix it.

Is there an auto folder program compatible with TOS 1.0 which fixes the CTS/RTS bug? Is it readily available, say on atari.archive? (I see hs_fix, which sounds like just what I would need if I had a TOS >=1.2. I don't; I have 1.0.)

If youre good in building models (working with plastic), and are
patient...
Drop in a teac low profile 720k drive... They are nice and VERY
quiet. My 1040's drive got shot, picked up a teac for like $50 (this is 2
years ago or so figure maybe a bit cheaper). It came with two face plates,
popped in the grey one, cut out the wierd drive openning on the ST to
accomodate the front face plate of the teac and the machine is working great
to this date. The only major difference between the teac drives and the old
mitsumi tanks built into the atari are some use less power, generate less
heat, the eject button is much easier to push, it uses a screw-drive carriage
mechanism for the head rather than the steel belt design of the mitsumi which
has allignment problems and the sort- and last but not least- Costs 1/3 as
much of a replacement atari drive.

3655. Bernouli box question

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-14 04:22:13 UTC
From: kenneth@matt.ksu.ksu.edu
Message-ID: <kfi6rIINNsrn@matt.ksu.ksu.edu>
Source record: 46694

I recently came upon someone selling a dual 44 meg Bernouli
removable media drive, and I was wondering if anyone knows
if the media change would work ok with a supra SCSI
controller board. The bernouli is supposed to be SCSI,
and if the controller card can deal with that, I think it
should work fine.

Anyone out there have any experience or comments?

Ken Samson

Well I don't think that it is possible to use a SC1224, as it has the
same scan rates as a PC CGA monitor, but with Analog Inputs, that meens
0-1 volt, not the TTL of 0/.4 to 4.5/5 that CGA uses.

The SM124 is very similar to a Super VGA, so that could be possible,
but you would have play with it to find out..

3658. Downloading to ST disk's using MTools on a SPARC.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-14 17:02:12 UTC
From: adm2@doc.ic.ac.uk
Message-ID: <1991Oct14.170212.29150@doc.ic.ac.uk>
Source record: 46697
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi Netters,
WE've just got some new SPARC IPX stations here,and I've been trying to download ST software from it to a ST or PC disk using SPARC-MTOOLS,which is a program for operating the sparc's floppy as a PC disk.But sadly it doesn't seem to work.So for instance when downloading a text file,you only get the first page or so repeated an infinite number of times,rather than the complete file.

Has anyone ever successfully downloaded ST software on a SPARC???

Has anyone even tried????

All possible replys would be appreciated.....

Alan.

3659. PS3000 monitor overheats?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-14 20:05:14 UTC
From: wright@hpcc01.corp.hp.com
Message-ID: <1550001@hpcc01.corp.hp.com>
Source record: 46698

I have an Atari PS3000 color monitor that seems to have a problem with overheating, and am wondering if anybody else has had similar problems. I am also wondering if this thing is likely to fail completely from the problem.

Some of you may be unaware of the PS3000 monitor. It was apparently a "limited issue" (i.e., unsuccessful) product that combined a color monitor with a built-in 3.5", 360KB floppy. A dealer sold it to me a couple of years ago claiming that the display quality was better than the standard Atari color monitor and that I could think of the extra floppy as icing on the cake.

Anyway, for some time I have noticed that after I use the monitor for about an hour the display becomes "unstable," meaning that the display jumps up and down and gets some interference in the display. Usually this will start off as an intermittent problem, apparently triggered by things like pulling down menus, but eventually the monitor will do this continually. At this point I can turn the monitor off, leave it for a few minutes, turn it back on, and have it work OK for awhile, when the problem starts again.

I finally got around to testing my suspicion of this problem being temperature related this weekend. When the monitor started misbehaving, I set a large room fan next to it, and was able to continue using the computer for another hour with no problem at all. I also noticed that the ventilation slots on the top of the monitor looked pretty inadequate, and that the top of the monitor was significantly warmer (before turning the fan on) than my monitor at work.

So, has anybody seen anything similar? Am I risking catastrophic failure of the monitor by running it uncooled? Any ideas for a better workaround than the fan?

> Has anyone ever successfully downloaded ST software on a SPARC???

I have a program called "raw2tar". To put a heap of files onto a floppy
on the Sparc II:

tar cfv /dev/fd0 filenames

Then, I take the disk home, and raw2tar creates a file "D:\a.tar"
(on your harddisk, or on a ramdisk if you are still floppy) that
can be untarred as per usual. The author of "raw2tar" doesn't have an
Atari any more, but the sourcecode, (plus a faulty version of the executable)
is somewhere on atari.archive. Grab it from there - but DON'T bother with
the executable, you'll have to recompile it (it's TINY).

>Do they have the same pin-out/bus-interface/command set ??

Both processors have the same pin assignment and the instruction set is
basically the same. The 68010 has some additional registers but these are
not important for the ST.
The 68010 uses an exception stack frame format that is different from the
68000. So you need a TOS version that recognizes the processor type. I
think TOS 2.0 might work but there are patched versions of TOS 1.04 that
run on the 68010. However, these versions are not official, I think.
Finally you have to think of commands like MOVE SR,Dn. On the 68010 these
commands cannot be executed in user mode. There are new commands like
MOVE CCR,Dn. A TOS working with the 68010 must react on a privileg violation
and convert MOVE SR,Dn to MOVE CCR,Dn like the TOS for the TT does.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MTOOLS on a SPARC - Station with SUN OS 4.1.1 did not work for me, but you
can do the following:

format an MSDOS compatible floppy (DD) on the SUN:

fdformat -Ld

mount the floppy drive as a PC file system:

fdmount

use the filesystem on the floppy as if it was a UNIX file system
(with the well known restrictions on file names):

cp *.txt /pcfs

(the floppy filesystem is called /pcfs)

unmount the filesystem after work is done:

fdumount

go to your Atari and simply use the disk as if it were an ST one.

If you want conversion between UNIX and Atari text format, use dos2unix
and unix2dos programs on the SUN.

Hope this helps. Hans

I have compiled Version 1.6 with Optimizer, etc... and these version
wrotes disk with bad fat entries! (Larger files contains a loop, very
slow reading, unreadable files, ...)

Try to get the newest version of Mtools.

3665. Does the CPU wait for DMA ?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-15 11:29:57 UTC
From: olaf@tpki.toppoint.de
Message-ID: <11139@tpki.toppoint.de>
Source record: 46709

Recently I got a dispute with a friend of mine about the
advantages of having a DMA chip in a microprocessor system.
I'm not an electronic guru, but for what I know about the
operation of the DMA chip within my computer, I always
thought that the actual transfer of data towards hard disk or
from my hard disk to memory is done (or at least could
be done) parallel to the running CPU. I.e., after the
CPU has started the DMA transfer, it can continue with its
programm, accessing memory as usual, and even alter the
contents of memory currently used for DMA purposes.

My friend denied that, and insisted that the CPU is put into
a halt state during DMA transfer, to avoid adress collisions
and to grant the adress- and databus to the DMA chip
exclusively.

So, does anyone know for sure, how DMA transfer is handled
in an ATARI ST ? Please, no guesses. E-Mail preferred.

Wrong. You CAN do DMA transfers from TT RAM to the SCSI port.

I think he has a very good point. Why can't we put in a MC68010 since we will
have a new TOS soon that I think should handle it? It raises the hope of a
easy/safe upgrade with a speed inprovement of about 10-20%.

3668. Setting my own midi buffer?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-15 22:34:01 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <GAUDREAU.91Oct15183401@juggler.East.Sun.COM>
Source record: 46710

Midi question for ya'll...

I'd like to use my own buffer (like a 100k) for midi input. I'm wondering what the correct sequence might be to set this up.

My ref books show that there is a vector to change but there are other pointers associated with this and I don't have the info on what to do with them...

Also, has anyone played with an interrupt driven routine to receive the midi stream? I'm not looking for rock solid input under heavy stress industrial situations, just simple input stuff (like I've envisioned flushing the input buffer, read 'n' midi tokens, and run with that).

Any clues would be helpful! Thanx.

Joe

Source record: 46707

```
There is nothing to be gained in speed by replacing your 68000 with
a 68010. Motorola say there would be a ten percent speed increase but
this depends very much on how you could re-write the binary code.
There are two ways of improving the performance. One is a simple
re-write such as
addq.l #8,sp --> addq.w #8,sp
someone should have a list of faster instruction table of equivalent
code.
The other is making use of the faster loop mode such as:
moveq #19,d1
L1:
add.w d0,d0
add.w d0,d0
add.w d0,d0
add.w d0,d0
dbra d1,L1
-->
moveq #79,d1
L1:
add.w d0,d0
dbra d1,L1

The first one does no harm to 68000, but the second kind of re-write will
be complicated and does harm to 68000 in terms of speed. Actually, there is
an example of this kind in TOS1.2.

Tsuji

In article <GAUDREAU.91Oct15183401@juggler.East.Sun.COM> gaudreau@juggler.East.Sun.COM (Joe Gaudreau {Dances with PostScript}) writes:
>Also, has anyone played with an interrupt driven routine to receive
>the midi stream?

I'm not sure what you mean by that, but I'll put in my 2 cents: I've gotten a MIDI ring to work by recieving _and_ forwarding in the interrupt; this gives really good throughput, since data is sent to the next machine in the ring as soon as it is received. (I wasn't using it for MIDI format music, though, just to send bytes around.)

One thing to watch out for is that older ST's sometimes drop MIDI bytes, so you'll have to be prepared for that. In my case, the ring would hang waiting for an end-of-packet after a seemingly random amount of time. I had to write a timeout handler to reset the ring to make it work with circa 1985 ST's.

BTW, the subject of running the MIDI port faster than normal may come up again here. I did extensive testing with this and found that you just can't get a reliable connection at anything faster than the standard baud rate, probably because the opto-isolators can't handle going much faster than normal.

Just some notes based on personal experience...

Source record: 46712

I've had a mega STe 2 for about 3 months, today, it began to
get flakey when I try to print, oftentimes it doesn't see
the printer. The printer is an original DeskJet.

If I shut everything off, turn the printer on, then boot the
system, I can access it for a little while, then it is no
longer there, I can still run the self test, so it looks
to be a computer or cable problem.

The things connected to the computer are a modem, an 85 meg SCSI
drive (replacing the 50 meg that it came with the computer) and
both monitors through the monitor master. I haven't put
anything new in my auto folder or accs lately.

I did put in 2 extra megs of SIMMs that I bought from an IBM guy.
(Should these work? 1 meg x 9) They were put in about 6 weeks
ago, and no problems till now.

Boy am I getting tired of atari...

It is physically possible to put a 68010 into your ST, but TOS versions prior to 1.6 are incompatible with anything but the 68000. So (in theory) any STe can take a 68010. Unfortunately, the 68010 (oops! - meant 68000) i the STe comes in a PLCC (square) package, while most 68010's that I have seen are in the standard 68-pin DIP (rectangular) package. Oh well. Howard Chu (@[something].jpl.nasa.gov) tried a while back to fit an Amiga 68030 board into his STe. I was off the net for a while, and never found out how it went - for a while he was searching for an adapter which would convert a DIP-style socket to a PLCC-style one.

I posted code a couple of days ago that shows how to fiddle with
the aux serial port buffer. The MIDI port is set up the same way, and
the code should be adaptable.

I haven't meddled with the MIDI port, so I can't offer specifics.

With the code above you _loose_ speed. A word which is added to an address
register has to be extended to a longword first. This takes 2 additional
cycles compared with addq. If you add larger numbers the fastest instruction
is as follows:
lea 12(sp),sp
instead of
add.w #12,sp or add.l #12,sp

> Is there some program hanging around which can deal with that ?

Simple question simple answer, use the ZERO PARTITION option of the
HDX program. This is the only solution since the HD-driver only expcepts
one format command; the one that formats the hole disk.

This does not make use of the 68010 loop mode. Please consult your
68010 manual to see the size of the prefetch queue.

Well, I've looked around a bit, and althought Supra's 9600 modem may not be the cheapest it is a decent price - especially if Supra is still offering their trade in your old modem for a discount on a new modem. Also, it seems to have all of the necessary standard error protocols. Of course, some of the BBS' I use in this area are not 9600 yet, so I may eventually upgrade.

```

Standard C bug. I'll bet the compiler is fine. Your code is buggy.

In both cases, you called sqrt() with an int arg. sqrt() expects a double. As per K&R, floats are promoted to doubles when passed as args. ints are never promoted to doubles. I forget whether ANSI C (aka K&R2) forces ints to be promoted in the presence of a prototype. I forget whether Sozobon is ANSI C compliant, but since you mentioned that the compilation was fine, either the compiler isn't ANSI C, or a prototype was not in effect for sqrt.

Try:

```
d=sqrt((double)(x-100)*(x-100)+(y-169)*(y-169));
or
d=sqrt((x-100.0)*(x-100)+(y-169)*(y-169));
```

and

```
printf("sqrt of 36 = %f\n",sqrt(36.0));
```

Casting the first part of the expression to a double will force the complete expression to be a double, which will be passed to sqrt() as a double. Changing the 100 to 100.0 promotes the expression to a float, which is promoted to a double when passed as an arg. Same for 36.0.

3683. WANTED: GIF --> SPC converter

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-16 17:39:21 UTC
From: steveg@cseic.saic.com
Message-ID: <3915450@MVB.SAIC.COM>
Source record: 46725
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm looking for a *high-quality* GIF to Spectrum converter that runs in a BATCH mode. (Feed it a list of files to convert, and let it fly).
It wouldn't hurt if portable source was included so I could run conversions overnight on a Un*x machine.

DMJ GIF 2.0 produces the best conversions I've seen to date, but takes up to 1/2 an hour to perform the conversion on a stock ST, or 17 minutes with AdSpeed running @ 16MHz, but that's still too slow to wait around for.

Can anyone provide me with a batch converter with comparable output quality? Even if it's slower, the ability to convert overnight will provide me with better 'throughput'.

> and kept control until the program had finished and thus released its memory?

You can run programs from acc's that do not use any GEM features
but since you cannot detect beforehand which programs will do so
doing a Pexec call from an acc will result in random system crashes.

I use a accessory shell sometimes all internal functions work fine, calling
pure TOS programs usely works fine (some called when another program
than the desktop is active will cause a system crash), calling GEM programs
will cause an immediate system crash or a system crash upon exit or during
execution.

There is no legal or reliable method that will solve these problems.

> What is the problem anyway?
AES and probably GEMDOS or VDI

Keep your facts straigth the neodesk clipboard is not an ACC it is controlled by NEODESK and cleared when another program is started or NEODESK is removed.

Concerning the accessory RAMDISKS, I don't know what they do but I bet it isn't legal. Ever tried to remove an installed SI_RAM disk with TOS 1.0 and reinstall it again and remove again? It may work but I the amount of free memory is changed (became much less) after this operation.

3687. Help with... keyboard buffer???

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-16 23:46:58 UTC
From: st11w@menudo.uh.edu
Message-ID: <1991Oct16.234658.2915@menudo.uh.edu>
Source record: 46722

Help! I have been having this problem with programms getting values
in scanf() and getchar(), etc... in looping functions. Do these
come from the keyboard buffer? Can I somehow clear it and see?
In almost all cases if I duplicate the input function (i.e.
scanf("%c", x);
scanf("%c", x);
then the program will promt the user correctly for the value. Otherwise
it gets a value from somewhere and uses it in the function.

I appreciate any help...

This is all good, but there might be an additional problem: you
have to tell the compiler that sqrt returns a double. Be sure that
somewhere the declaration:

double sqrt();
```

is given

MTOOLS creates disks with two FATs, but only the first one is filled with
sensible data. TOS reads the second FAT to find out the cluster sequence
of files - but finds nothing worthwhile there. You can use a disk monitor
to copy FAT #1 to FAT #2, and everything will work out fine.

I do believe, sqrt takes a float value, or double doesn't it?

Your pushing ints in your stack frame, that might be the problem.

At least my reference says it takes a double..ie sqrt..

try this:

double x, y, d;

d=sqrt((x-100.0)*(x-100.0)+(y-169.0)*(y-169.0));

OK? I hope this helps you out.

I believe this used to be true of the old version of MTOOLS, unless
some compiler flag "DUPFATS" or whatever was set during compilation.
There is no longer a problem with version 2.0.3 that I am using.

3692. GDOS driver for Canon BubbleJet 10

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-17 15:03:52 UTC
From: optimiza@utrcu1.UUCP
Message-ID: <936@utrcu1.UUCP>
Source record: 46730

The subject says it all: does anybody know if a GDOS driver for the Canon Bubblejet exists, and, if so, where I can get it. I like the portability of the thing, and in combination with the ST notebook, you'd have a nice setup

3693. Midi and MFP68901 clock speeds

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-17 15:53:59 UTC
From: rjwalsh@unix2.tcd.ie
Message-ID: <rjwalsh.687714839@unix2.tcd.ie>
Source record: 46728

What is speed the maximum (safest) speed the midi port can operate at?
How do I set a specific baud rate for the midi the port? Also what speed clock
is fed to the 68901? How do I set up one of the timers to operate at a specific
speed (e.g. 16kHz)?
--

The fastest speed it can reilably operate at is ~32K baud, which is the
default (also the MIDI standard), although it can theoretically run at
256K baud as well. (Note: theoretically = does not actually work)

I think changing the baud rate involves setting some bits in a hardware
location; I don't remember the details but it's in ST Internals and is
very easy. If you want some code to do it, I can dig some up.

I would like to design some new icons to add to my desktop (MegaSte).
Is there a PD program that I can use to do this? Is it in atari.archive?
If so, what is it called? Thanks for your help.

>would convert a DIP-style socket to a PLCC-style one.

The story ended unhappily; the accelerator was designed to interface to the
Amiga's 7.xx MHz bus and didn't work too well on the STe. In fact, it was
very good at drawing bombs non-stop across the screen, but not much else.

The worst part of the deal is that I returned the accelerator to the CSA
company over two months ago and they still haven't sent me a refund. The BBB
is getting a complaint next week...

3701. bad data warning on floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-18 15:49:14 UTC
From: fnjlh1@acad3.alaska.edu
Message-ID: <19OCT91004914@acad3.alaska.edu>
Source record: 46796

My ST's external B drive (SF314) sometimes returns the dread
"Your data may be trash..." warning, but does not consistently do this on
the same disk. I notice this most with Pagestream and trying to load fonts.
I have the speed check prg somewhere, but is there some way to align the
head with the data track? Are there other possibilities I can check?
Thanks for any help. j harris\fairbanks

3702. Floppy problem

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-18 16:14:49 UTC
From: m88max@bellatrix.tdb.uu.se
Message-ID: <1991Oct18.161449.11156@corax.udac.uu.se>
Source record: 46793

I have a old ST with a external Cumana drive and (i think) TOS 1.0
When i turn on my ST the disk starts to spin but the light on the drive doesn't
light up. After a while the desktop shows on the screen
but without the floppy icons.

Does anyone know of this problem?

Please let me know what to do!! (Yes a know i can take the box to a shop and
get it repared but i still want to know).

/Max Brante

3703. Tar to SCSI tape drives

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-18 17:46:37 UTC
From: lunnon@qut.edu.au
Message-ID: <1991Oct18.124638.36111@qut.edu.au>
Source record: 46731

At home I have an adequately large HD which requires lots of floppies
and lots of time to backup.

At work I have a SCSI Exabte tape drive which I can borrow for the
Weekend.

A little while ago HCJ (Howard Johnson) I think said something about
a tar program for ST's which could write SCSI tapes.

Anybody remember this and where can I pick this up. Atari.archive
does not appear to have this little gem :-)

Howard, are you listening ???

Message-ID: <26840001@hpcvca.CV.HP.COM>
Source record: 46795

GEM programming query #2715:

Is it possible to write a GEM program that doesn't have a menu at the top of the screen and allows you to move windows, draw, etc., into that area?

I would like to use Jan Van der Steen's popup menus and get a little more screen space for my application by not having a top-of-the-screen menu, but when I do a wind_get on the Desktop it thinks there's a menu at the top of the screen.

If it is possible, what happens to Desk Accessories when there is no menu bar?

I may not been clear as to what I was looking for with my last post.
I'll try again. Are there any programs (comercial or PD) that will
allow me to emulate a 3780 terminal with my Atari? Any info
appreciated. Thanks in advance.

3706. DataLink 1.00

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-18 21:06:27 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <g67102w164w@ersys.edmonton.ab.ca>

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello. DataLink 1.00, a new communications program, has just been uploaded to atari.archive.umich.edu and will soon be available. The filename is currently DATALINK.ZOO. Following is an excerpt from the text file included in the DataLink archive.

D I S T R I B U T I O N

You may upload this archive anywhere you please, so long as the information contained within it is not altered in any way. DataLink *can* be included on User Group disks that are being sold, but may not be sold for profit.

D A T A L I N K F E A T U R E S

Welcome to the wonderful world of telecommunications!

DataLink is the newest program to hit the market, and chances are it's just right for you. Some of the best features found in commercial telecommunications programs are now at your fingertips.

An easy to use Group Dialer will let you select a group of BBS systems to call, and then dial each one in the sequence until you have connected to every board in the chain.

The normal dialer used by DataLink will dial a BBS system until you connect, keeping track of how long you have been dialing, how many "BUSY", "NO CARRIER", and "NO DIALTONE" messages have occurred, and how many times you have dialed.

Both of DataLink's dialers show the name, the number, a comment, and the baud rate of the BBS being dialed. You can store up to fifty BBS systems, along with the appropriate information, in each dialing directory. There is no limit to the number of dialing directories you can maintain.

DataLink also provides you with a complete set of disk utilities, including copy, move, delete, rename, print, make folder, delete folder, touch file, append file, and free disk space.

Do you ever get tired of typing in your name and password every time you want to log-on to a BBS system? Sure you do. DataLink will allow you to put this annoying problem behind you

forever. You can enter up to ten strings which DataLink will search for, and up to ten strings to reply with when the search strings are found.

DataLink also provides you with a 32K buffer so that you don't miss important information. The buffer is saved automatically when it fills. Or, if you want to save disk space, you can set the buffer not to save until you tell it to from terminal mode. Using the latter method, the buffer empties when it fills. This buffer is also used in disk operations, so it is saved before every disk operation that uses it.

Can there be more? Yes!

DataLink provides you with twenty function keys, which let you send a string with a single keypress.

Have you ever wanted to run a program from inside your terminal program, but found that the program only gave you a few spaces to enter a command line, or made it so difficult to use the execution feature that it wasn't worth it? DataLink makes this problem a thing of the past. With one keypress from terminal mode, you can run any of ten pre-defined programs. It's that simple!

Want more? So did I, so I kept adding to the program!

From terminal mode, you can look at the date and time, set the date and time, select full and half duplex, echo mode, execute a file, load an external editor, and even access accessories!

DataLink also has a Notepad mode, which lets you make notes while you are online. You can save the notes too!

DataLink allows you to use RTS/CTS, XON/XOFF, both, or neither.

DataLink will even let you select the path where downloads go! [Note: This feature has been removed. See reason at end of file.]

S Y S T E M R E Q U I R E M E N T S

DataLink will run from a single sided floppy drive. It has been compressed using PFX Pack 1.8 (Thomas Quester) and uses about 270K of memroy (including the 32K data buffer and the 32K screen buffer) so it will easily run on a 520ST. You can un-PFX Pack DataLink with PFX Pack if you want to.

The selection of download paths was removed because I changed the way DataLink handled transfers. It now allows you to press Alt-G from

terminal mode to call XYZ, and you enter the command line. This allows you to use all the protocols, all the options, and even a different program if you want. Alt-I calls YMG, for the same reason. I think that this method will allow for greater flexabilty, even though you have to type a little.

I mention in the text file included in the archive my address (for various reasons) and I would be glad to here comments, criticisms, etc. from anyone who uses it.

A lot of people who read comp.sys.atari.st and comp.sys.atari.st.tech have offered advice on how to utilize certain parts of the ST operating system, and I would like to thank them now. They know who they are.

3707. STacy specific information

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-18 23:46:00 UTC
From: UI0T@DKAUNI2.BITNET
Message-ID: <"91-10-18-16:46:12.01*UI0T"@DKAUNI2.BITNET>
Source record: 46740

A friend of mine owns a STacy, and he would dearly like to have some
information about it.

What he'd like to do, ultimately, is to write an accessory to

1) dim, switch on and off the background lighting for the screen

2) switch the hard disk drive off (reversible) when he wants to

For this, he also needs to know how to

3) establish wether or not this program is running on a STacy

How can this be done?

Any help appreciated.

>BATCH mode. (Feed it a list of files to convert, and let it fly).

>DMJ GIF 2.0 produces the best conversions I've seen to date, but takes up to
>1/2 an hour to perform the conversion on a stock ST, or 17 minutes with
>AdSpeed running @ 16MHz, but that's still too slow to wait around for.

>Even if it's slower, the ability to convert overnight will provide me with
>better 'throughput'.

DMJ Gif 3.0 should be (I'm praying every night. I want it THAT BAD!)
released by the end of October or the first few weeks in November. It will
have batch mode; feed it a bunch of GIFs to convert, and a destination
path, and it will automatically convert 'em. It's supposed to offer a few
more dithering modes, a totally rewritten interface, and there's an
emphasis on flexibility of options. Really complete, thorough program.

As an aside, if you don't pay your Shareware dues for this program, you
really are the lowest form of life on the planet. It doesn't take a rocket
scientist to see that Shareware for the ST is being produced in lesser
quantities each year. By supporting what little quality stuff is being
produced (DMJ Gif is a glowing example), you are ensuring the speedy demise
of the ST. No computer is useful without continuous software support.

{Getting off soap box.}

For some reason Atari left out the Clock lines for you to use Synchronous
Communications, the HardWare is there but missing these clock lines,
you would have to write the software your self and add these clock lines,
(TXC and RXC)..

Source record: 46802

I can't get the STOS compiler to compile anything. I've followed all the instuctions. I got the language and the compiler at the same time, but they are different versions. The compiler is V. 2.5, while the language is 2.6. Could this be the cause of the problem? I looked on the language disk and there isn't a program to change a 2.5 program to a 2.6 program. Does a program like this exist, and if so is it in the public domain? I keep getting a Extension error at line 10000, which doesn't even exist.

Does this Program support Zmodem Batch uploads,
I have fould that a lot of Term programs use the XYZ.TTP for file
transfers, but there is a big problem, it does not support a real
Batch mode, only a wild card mode, or all the batch files have to be in
a folder..

Well does it support 32 meg partisions, and will it do incremental
back ups, and also restore any files that you like,
if so I am interested.

Well there was a good deal of support on GEnie for STOS, plus a few
patch programs..

Also in the UK there are some good books and a STOS club..

.
.
.
You're going to need more than software if you really intend to to run bisync.
3780 Bisync terminals connect via coax cable to a 3x74 cluster controller,
which in turn attaches to an IBM channel (if locally attached, or to a 32x5
front end via modems if remote).

If the IBM machine your using has a protocol converter (which emulates the
3x74 cluster controller to the IBM system, but allows async connections into
it, you should be able to use most any terminal software that emulates any
of the terminal types that the protocol converter supports. VT100 would be
a likely candidate.

I use UniTerm v2.0c this way regularly.

The compiler also needs to know that the value returned by sqrt is
a double, i.e:

#include <math.h> or
extern double sqrt();

3719. ATARI ST MINIX - how does it cope with fork()?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-20 21:02:13 UTC
From: rjwalsh@unix2.tcd.ie
Message-ID: <rjwalsh.687992533@unix2.tcd.ie>
Source record: 46810
Cross-posted to: comp.sys.atari.st.tech,comp.os.minix

Say I do this on the Atari ST version on Minix...

```
main(){
...
fred(&a);
...
}

fred(a)
int *a;
{
...
if(fork()==0){
...
printf("%d\n",*a);
...
}
...
}
```

Would the reference I make to '*a' in the fork() refer
back to the parents address space, or does Minix have some way
of knowing where abouts pointers are kept on the stack, so it
could adjust their value to point into the child's address
space?
If not, is a real fork() command not really possible on
an ST? Hope someone can help....

DataLink will allow a 78 character command line, so that is what you have to work with. In the next version, I'll add the ability to write a TOSEND.INF file so that you can use that option and then pass the TOSEND.INF to XYZ using the -1 option. That should make it a little easier. For now, though, you should probably use wilcards or as much as you can fit on the command line. If you have a better suggestion, I'll be glad to incorporate it. I don't want to tie DataLink too tightly to any transfer program, since it is designed to be able to use them all.

Hi!

I need a key-slot (ROM/modul-port) switcher form my Atari Mega4, so
that I could run two key-protected applications under the
MROS-switcher.

If you know anything about such product or availability or source for
one, please reply/followup.

Yes, you can restore any file, file type or partition. It does support increme-
ntal backups too.
It claims to support any standard TOS/GEM device. It handles 44meg cartridges,-

floppies, hard drives and network drives. I haven't tried 32meg partitions
myself but I don't think it would be a problem.
A bonus is that if you want to read a file on the last disk of the backup,
you don't have to feed the whole lot in to get to it. It's smart enough
to pick it up at any point.

Doesn't xyz support several files on a command line? If so you could use the file elector to select files to u/l and use cancel button to signal when you have selected enough files. Keep track of the selections and pass that to xyz (or whatever zmodem prg you use)...

All SERIOUS users use monochrome? As soon as I get around to buying a
monitor switcher, the sooner I can stop using Gumby resolution. Medium
is so UGLY after monochrome - I spend most of my time editting source code.

Anyone got some good RGB values for minimum eye-strain in colour text modes?

I would suggest that changing the opto's would have no discernible effect on the rate at which the MIDI stream can be broadcast at. See the latest version of the MIDI spec. for more info and reasons why.

As for bytes dropping, I don't know about this. anyone else?

Fork on the ST uses 'shadowing', meaning that on a context switch the
whole data-segment is swapped. This is if course very expensive for
processes with large datasegments, but needed because of the lack of
virtual memory. So it is not wise to perform fork() without soon doing
exec (then all segments are replaced) under minix for processes that
do not have a very small data-segment.

From what I can remember, as I only had a quick play with XYZ 202 ?,
it could not do a batch upload with explicit file names.

Terminal programs must support Full ARCV, none of this 125 character
command line limit.

Uploaded files can be all over the place and in some folders deep, this
is why the 125 limit is far to short.

I get involved in uploading lots of files to BBS's, but at the
moment I am limited to 3 files per upload, I use the GSZRZ18, this is
the German Gem Zmodem program, but still only uses the command line..

This is the way I had the transfer system set up to begin with. XYZ was
required to use DataLink. I later changed my mind and removed that
aspect of the program, so that people can use any transfer utility they
want. The method you suggest would work up to a point; I don't think
that XYZ uses the ARGV standard, so it wouldn't be able to receive very
many files on a command line. It does allow you to write the files to a
file, and then use that file for input though. This should work in
theory, but I had an extremely hard time getting it to work at all. In
the next version of DataLink, I will add the ability to construct a file
that you can pass to XYZ. The feature will let you select files until
you hit cancel, and it will write them out to a file of your choice.
Then you can pass the filename to XYZ while you select your transfer
type and other options.

There is a possability of a color version, but I'm not too sure about it.
I only have a Monochrome monitor, and the RF Modulator that connects the
ST to my TV is broken for some reason. The reason DataLink will only run
in Monochrome (I tried color when I had it) is that the RSC file has
dialogs with a lot of information in them. When I was designing the
dialogs, I was intending for the program to be used on a Monochrome
display so it never occured to me to make the dialogs smaller (but more
complex). If I get the RF Modulator fixed, and if the users show enough
interest by sending in their $5, then I will work on it until there is a
color version. DataLink doesn't do anything that should cause problems
in color, except for the size of the dialogs, so it shouldn't be too hard
to get it working in color after I re-organize the dialogs.

I agree with you that color is painful on the ST. It isn't so bad on the IBM machines with Super VGA, but it still annoys me. If I could have made DataLink support color I would have, but the RF Modulator that connects my ST to my TV is broken, and I don't have a color monitor. I said in an earlier message that I would make DataLink support color if the users supported the product by sending in their $5, which will allow me to buy a RF Modulator. I want to make DataLink as good a program as I can.

I remember hacking the 'gnutar' some time ago and having had troubles. The 'gnutar' for atarist had been bugged and it didn't allow for diskettes to be written on, hence there was no communication with MinixST's tar. The trouble was that there was no established denomination for the disk drive. When I hacked, I simply followed the MinixST line and used the names like /dev/fd0, etc. Unfortunately, when it came to writing or reading ordinary SCSI devices, the built-in device driver couldn't cope with 'tar' because when the media was properly formatted, it contained the proper media information and allowed the tar to write onto it but once the tar had overwritten the boot sector with its own header, the device driver found itself at a loss. The only way out seemed to lie in incorporating the device driver in the 'tar' itself. And there is no way of doing so as there are too many SCSI devices about. I wonder if 'tar' had a feature of preserving the boot sector intact.

Tsuji

Well, I've just download both gnutar.zoo and tar.lzh and none of them are
for writing to SCSI tape streamers, I don't think this possible without
writing some sort of extra driver that could talk through atari's DMA interface.

The DeskJets are known to be troublesome on the ST. If you turn on the ST before the DeskJet 500, it't GUARANTEED not to work.

There are several accessories out there that correct this problem (it's just a bit in one of the chips that drive the printer interface that must be flipped -- forget which).

I suggest you get one of these accessories and try it out.

Well, this is something I've been looking for as well. I have a message that was posted by Paul Moreau (paulm@ccicpg.uucp) in Irvine, CA in November 1990.

He said that he had a tape driver and a tar to go with it that could read and write *ix compatible QIC cartridges just fine. He offered to send it to anyone who asked. I did ask but apparently never managed to get through to him.

Maybe that was what you remembered. [Paul Moreau, are you still there?]

I have all necessary info to write this beast myself, I just don't have the time right now. What Paul offered sounded neat since the driver was separate from the tar, the driver being resident and available to other programs via a trap #13 interface.

If someone out there has such a beast, or something simpler with an integrated SCSI driver, I'd be very thankful if it could be uploaded to atari.archive.

Thanks!

In recent helpful communications from Mr. Klaus Guhr in Germany about the TT
SCSI port hard drive, he mentioned there is a very good hard drive kit for ST
will support STREAMER, which I think he means the tape drive.
The product is call Megadisk and put out by Veba Application in Germany.
Does any one has use it with a SCSI tape drive, or SCSI CD-ROM, or SCSI
3.5" 20MB floppy drive?
Is there a distributor in USA or Canada?
Veba's address? price?

Well, not exactly GUARANTEED: it depends on the individual ST. Sometimes I can turn on my Deskjet 500 and the ST won't see it, other times it will. Some STs see it all the time, and some can't drive the Deskjet for long periods (print starts to get flakey). I've never had any problems at all.

I think both these problems are due to excessive current drain through the rather weak ST parallel port. The way to solve the problem is to buy a parallel port buffer (they're about 25 quid here in the UK). This is basically an octal line driver which can stand a higher current drain than the unbuffered Yamaha sound chip used by the ST for its parallel output.

This may sound like an odd question, but should the Atari MegaFile 30 hard drive make any kind of a sound when it writes to the media? Mine makes this chirping/beeping/squeeking kind of sound when it does a write, and sometimes when it does a read. It did this when I bought it, and it still does it four months later. It frightened me then, and it frightens me now. The dealer I bought it from told me this was normal, but this is also the same dealer who sold me a defective monitor, disk drive, and THREE defective mice. (I have since switched stores of course, but they were the only one at the time.) The Hard Drive is no longer under waranty, and I would really like to hear if anyone has had the same type of problems, or whether or not this is normal. I spent $535 on that drive, and it would be terrible if it died. If anyone can help me out, *please* do.

I remember that one, I *did* get the code from Paul, it's around here somewhere. I intend (one day) to try and get it together. I have a (bare) cart tape drive and apparently ICD do a SCSI controller for it. Trouble is, I need to lash out $125 for the SCSI controller before I find out whether it's possible or not. Now that DAT is replacing cart tapes, obsoleted cart tape drives should be coming available on the second-hand market and it might be worth doing. I remember having an e-conversation with Howard about the matter. If anyone's interested, I'll have a look through my disk storage box and see if I can turn up Paul's code.

Cheers,

How loud is it? It sounds to me like the stepper motor's normal
"chirp." Megafiles are a little loud, but no more than a floppy
(usually less so, but higher pitched). The key to peace of mind with
a hard disk is backups. Buy Diamond Back. Keep two sets of back up
(the "current full save" and "the full save I made before that". Then
do incremental saves periodically. Schedual it regularly. The
first time you skip a back up will be the time the disc drive
explodes taking half you're bedroom with it. Keep one set of your
backups at work. The other at a friends house. When the house burns
down, the backups will still be there. (I don't know about you, but I
have personal research projects on disk that I would want to preserve,
even if I lost all my other worldly goods). Never be dependant on a
single peice of hardware continueing to function.

what does one need to do to get a tape drive backup for their hard disk. I have the MicrO shoebox which is a SCSI hard drive, and it has space for another device. So could I just get a generic SCSI tape drive, mount it in, and use the tar to backup the hard disk?

Is it more complicated. I called MicrO and they were talking a price well about what I paid for the hard disk, plus it wouldn't fit in the shoebox. But I know venders who sell the generic tape drive for fairly cheap. Will that work?

>
> Thanks
>

If you have a good look at the article, the Author uses SIPS as they
are soldered onto a piece a matrix board, you can't solder the SIMMS
into the matrix board, you would have to fit sockets to do this.

There is another article that uses SIMMS, you solder wires to them,
and the SIMM boards are stuck down onto the main PCB, (with double
sided tape) in the place were the old 1/2 meg is removed.

I have fitted SIMMS to my 1040, but I have used sockets and have fitted
4 of these so I can goto 4 megs if needed, present 2.5 megs..

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've sent the latest version of the MiNT library (patchlevel 14) up to atari.archive.umich.edu. There are a lot of changes from patchlevel 10, most notably support for the new features of MiNT 0.9 (which is being beta-tested now; sorry for the delay!). If you want a sneak preview of what's going to be available in MiNT, grab the libraries :-).

I hope to have the new version of MiNT itself in a shippable form in a week or two (fingers crossed).

This is an interesting suggestion, but not exactly what I was looking
for. I do keep regular back-ups, but I only keep one set. The set
contains everything that my Hard Drive contains, and old programs that I
don't use until something goes seriously wrong. I spent more time
listening to the sound, and it occurs when the drive is "searching" for
something, like a directory or a place to write to the media I think.

I'd still be interested to here from other MegaFile owners...

3753. name of DESKTOP.INF

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-24 12:25:22 UTC
From: epkst1@unix.cis.pitt.edu
Message-ID: <194630@unix.cis.pitt.edu>
Source record: 46834

Is there any way (preferably TOS independent) of changing the name of the DESKTOP.INF file?

One would think that this is pointed to by some vector and that it would be possible to change DESKTOP.INF to DESKTOP.FOO.

has anyone out there done their own RAM upgrades on a TT030?
our unit currently has 4 meg, with 16 "4C256" chips on the motherboard and
another 16 on a piggyback board. the ones in the motherboard are
socketed while the ones on the piggyback board are not.

can one just pull the 4C256's on the motherboard and replace them with
4 megabit (??) chips?

thanks in adance

>scanf("%c", x);
>scanf("%c", x);
>then the program will promt the user correctly for the value. Otherwise
>it gets a value from somewhere and uses it in the function.

You propably have the well known problem of forgetting to read the
newline character.
scanf("%c",x); reads one character and only one, so the newline character
that is always needed to flush the buffer remains where it is.
Leading to the next scanf("%c",x); (shouldn't that be &x) to only read the
newline character and not the character typed.

solution: char x[2]; scanf("%1s",x);
meaning: read a string of one character and skip all leading spaces
including newline and tab characters. Note that x should be
an array of two characters to be able to store the NULL character
as end of string.
The first scanf will behave precisely as the scanf("%c",x); but
the second one will first skipp the leading '\n' character before
reading the one character of the new input.

Hope this solves your problem, if not be a little bit more precise of what
the problem is.

>Is it possible to write a GEM program that doesn't have a menu at the
>top of the screen and allows you to move windows, draw, etc., into that area?

As far as I know, NO
It is possible to write a GEM program that does not uses menus but the
bar at the top is not part of the desktop so not available.
The only way I can think of is using wind_set to install your own desktop
but I doubt that it will work. But you can still use popup menus look at
RUFUS, it uses a popup menu that is the same as the GEM menu execpt that
you cannot call accessoires from it. Another way might be to copy the mostly
used menu titles in a popup menu I think that will be very convenient to use.

Further if you want to program GEM application try to follow the general
look and feel layout. It is difficult to find a usefull guideline but
trying to follow the general trend will attribute to making all programs
use the same menu and dialog structure. Which in return will make your
program much more succesfull.

Perhaps someone at Atari is willing to publish a few simple rules for
us PD programmers that cannot affort to become/or do not want to be
a registered developer.
(This is not a flame, just an appeal)

> >>>a tar program for ST's which could write SCSI tapes.
> >>>

With regard to TAR and SCSI tapes.

I have an Archive QIC-36 drive and an Adaptec 3530A SCSI adapter.

The current state of affairs is that each program that uses the drive
has to have embedded in it a driver. In my case, I have two programs,

backup; to write and read one or more partitions. And
cpio; a hack of the UN*X one that will handle (in and out) UNI*X
style tapes.

Atari has a much nicer platform, for such programs.
It is called Meta-DOS, and allows "loading" drivers and using
standard open/close/read/write GEM commands. They produced it
to support the CD-ROM player.

Writing a Driver for Meta-DOS is fairly simple. But unless Atari
releases it, it will only help owners of the CD-ROM.

Generally, at the source level, there should be only small differences
between SCSI Cartridge Tapes. The read/write commands are pretty
standard.

Anyway, I have a EMAIL package of the sources for backup that I have
sent to some 20 people. (Tho I've never heard if they used it --
maybe it disassociates their atoms or such).
Please note that this contains C and S modules written for MWC.
The C code is no problem if using another compilation system; the
Assembler S modules will require changing the syntax of each
line.

>(print starts to get flakey). I've never had any problems at all.

Some time ago I got a small schematic of a modification for the ST to
fix the problem. In that modification a pnp-transistor was added to
the strobe-line of the printer port. The original strobe from the soundchip
has to be connected to the base, the collector to ground and the emitter
goes to the printer-connector. This will perhaps be critical to some sound-
samplers, but with my Deskjet it works perfectly.
>
>Does anybody know _which bit_? (No guesses, please)

It's bit #5, so an ongibit(5) works at all.

Source record: 46753

I am using sozobon , and would like to know if it is possible to
somehow use vars more that 32K in length, such as

```
int old[320][200];
```

The compiler says its fine, but at runtime, it bombs, but at
a 100 by 100 array the program is fine. I assume this is due to the
32K variable length, correct? Is there a possible way around this?
It says 'local variable' limit.... just thinking there may be some
easy way to bypass it.
Any help or info would be appreciated.

>
>Why do you want to change the name?
>

I have written a program to allow the resolution of an ST to be chosen at boot-time. This /auto folder program takes a very low-tech approach: based on the choice (or default) it copies an appropriate file into DESKTOP.INF.

All this would be much cleaner if I could just point to one of three different DESKTOP.INF files.

My program (BOOTPLUS) allows you to specify programs to be run during bootup based on the resolution. (e.g. - I only use a mouse doubler when using medium rez, or if I used a monochrome emulator I could run that whenever high rez was chosen.)

Since it looks like copying is the only way to go, I will probably call this thing done. If there is interest, I could post it to atari.archive.

3769. Interrupt handling mouse & midi.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-25 09:09:11 UTC
From: geert@ccsds.ahold.nl
Message-ID: <2921@ahds.ahold.nl>
Source record: 46747
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am (still) writing a midi program for a synthesizer. Because the
synthesizer I have, can sent lots of data in one time I must
have an midi interrupt routine that works indepently from
the mouse interrupt routine.
I have written an assembly interrupt routine to
read the mididata from the midi port of the ST, but when I sent
lots of data to the ST and I move the mouse, even this results
in loss of data.
Unfortunately, atari has connected the midi and keyboard chip (which
handles the mouse) to the same interrupt pin on the interrupt chip.

Now my questions.

Does somebody have the same experiences?

Where can I obtain info about the mouse routine of the ST, so that
I can write a new (and faster) routine for the mouse, which does
correctly handle midi & mouse together?

Maybe there is an other solution for this problem, any help
appreciated.

Geert.

3771. Why does my HD drive interfere with the video?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-25 12:51:52 UTC
From: nico@cs.ruu.nl
Message-ID: <1991Oct25.125152.13241@cs.ruu.nl>
Source record: 46748

Recently I replaced my broken internal floppy drive (720 kB, 1040ST) with a high density drive. I did not upgrade to high density yet, since that requires a new floppy controller (WD1772 (is that the right number?) from VLSI don't work at higher speed) so I just connected the drive to the cables that were already there.

Since I did this, I have the following problems:

1) When an external drive (5.25") is connected, the screen flickers. Moreover, the brightness varies every time the floppy drive is accessed to check if a disk change has occurred. I can see this because when the check is performed, the light on top of my Atari is on for a very short time, which is normal. This gives a 20Hz flicker of the screen, which is extremely annoying.

2) When I disconnect the external drive, the problem is gone. However, when I print something, the brightness of the screen varies somewhat, although less than with an external floppy connected.

Might it be the case that the power supply can't handle the load of a HD drive? I also have a 2meg memory expansion (Xtra RAM) and a 80286 (AT Once) installed. So is it possible that during drive access the power supply voltage drops, thus creating trouble for the video circuitry?

3) Every time the Atari accesses the HD drive to check for disk changes (about 20 times/sec.) I can hear the drive make a clicking sound.

My guess is that the pulses sent out by the controller are just right for a DD drive, but too wide for a HD drive. Could this be solved by installing the HD-circuitry (and continue to use the drive at 720 kB, until I have a new controller)?

The abbove expanations are my own guesses, but I might be completely wrong. Therefore:
Could somebody please explain why these problems occur, and how to solve them?

Best regards,

Try making the array an array of pointers to 320-byte-long arrays, like so:

```
#define COLUMNS 320
#define ROWS 200

int *foo[ROWS];

void
initialization()
{
int i;
extern char *calloc();

for (i = 0; i < ROWS; i++) {
foo[i] = (int *) calloc(sizeof(int), COLUMNS);
if (!foo[i])
/* You lose -- no RAM */
}
}
```

From then on you should be able to say "foo[row][column]" with no
problems. (The compiler will know it's not a simple two-dimensional
array, so it won't generate multiply instructions to calculate
offsets. Doing it this way is usually faster, too.)

>whenever high rez was chosen.)

One way that you might go is to install yourself as a TSR, and sit
around and monitor the GEMDOS trap - whenever somebody tries to open
"C:\DESKTOP.INF", replace the argument with a pointer to your own
DESKTOP.FOO. I can see many problems with doing this, not the least
of which is that it would slow down file accesses like molasses.

>

You didn't post a code example, but my guess is that you created old[][]
as an auto variable -- inside a function.

Auto variables are created using the stack, which is a finite (and not
especially large) chunk of memory. They are allocated from the top down,
and declaring old[320][200] as an auto variable generates code like this:

_main:
link a6,#0
sub.l #128004,sp

The compiler has no way of knowing that you have just requested more
memory than the stack can provide. The stack pointer (sp) now points into
space that your program doesn't own. If the space is owned by a user mode
program, your program can corrupt it (any function call will do the job).
If the space is owned by the operating system, the 68000 will block any
attempt, paint bombs on the screen, and kill your program.

If old[320][200] is declared outside a function, or if the keyword
``extern'' is used before the object type, the compiler will generate code
that allocates the space in the program's BSS (block storage segment).
I've had no troubles with large variables in that space.

From: cjherborth@rose.uwaterloo.ca
Message-ID: <1991Oct25.175552.15242@watdragon.waterloo.edu>
Source record: 46758

I've got a half-populated Z*RAM board sitting in my ST, which I'd like to pump all the way up to 4M... My problem? The local electronics supply store wants $9/chip, which works out to almost $170 for two megs after taxes... Not good.

So, can anyone recommend a chip supplier in North America who would have 1Mbit DRAMs for < $9 each?

Message-ID: <1991Oct25.141011.1@ulkyvx.ct.louisville.edu>
Source record: 46759

Can anyone tell me how to program the ST to backup an 720k floppy disk in a reasonable time. Right now I am useing the straight xbios commands to read format and write the tracks. I've found that it take somewhere around 6 seconds just to do 10 tracks (or 5 double sided tracks) in formating alone. I've played with the interleave a little and made that time twice as bad. Any suggestions for this problem?

PS: Yes, I am useing even address...

Both - I'm very busy setting up four Sun SPARC 2 at work and the enourmous
amounts of memory to be used into this computers (max. 96 MByte!) somehow
converted KBytes to MBytes.

Source record: 46767

```
The way most mc68000 C code generator allocates local variables is
giving an address offset from the current stack. Thus, a local variable
is expressed like
2(sp),-2(sp), or 2(a6) or -2(a6)
And the offset has to be a signed 16-bit entity. Which means that if you
want a large local array, you must not declare
function(foo) { int array[35000]; ...

but
function (foo ) { static int array[35000]; ...

because static variables will be allocated to a memory address relative to
the start of the program. All of this means that mc68000 has been designed
with an idea in mind that local variables used in recursive calls will not
exceed 32K.

Other largish compilers such as GNU C allow 32-bit size local arrays on
stack. They use other addressing modes when the stack offset is more than
32 K.

I think that this is the case. I run my 46 meg hard disc from the power
supply of my 1040 STFM, and when I have an external floppy attached, the
screen dims just a little during floppy access. If I switch off my hard
drive there's no problem.

The answer to my (relatively minor) problem is to buy a proper PSU for my
hard disk; I don't know what to suggest to fix your problem.

The printf function does know that there is a double on the stack. That's
the way C passes both floats and doubles.

3784. Flight simulator II and 1040STe

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-26 17:38:15 UTC
From: dbsuthe@PacBell.COM
Message-ID: <24905@pbhya.PacBell.COM>
Source record: 46773
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have used the microprose Flight Simulator II for years, and was sad to find that it (apparently) fails the copy protection when run on my 1040STe. It runs, but it goes to "demo mode". A call to microprose requesting an update was not fruitful.

Does any-one have a version that does run on the 1040 STe with color monitor? If they do would they be willing to supply a copy?

I do not believe in piracy, and will be willing to risk sending my original disk as proof of ownership.

An alternative might be a patch for the original program that turns off the protection check.

Any Ideas, any-one?

What are the pull up/down resistors used in these drives, ?

The sound IC can only handle drives with 3.3 k resitors, a lot of 5 1/4
drives use 300 ohms, these MUST be removed..

You should remove these resistors or fix a buffer IC, to the drive
select and side select lines....

Well I fix ST's with out any Rom list, plus there are none, so get the SAMS Computerfacts on the Atari, I have one on the old 520 ST, and its has help me a lot, they could even have some new ones by now as the one that I have is old..

If you need a set of Roms, there must be lots of them from people that have upgraded to a newer TOS..

Well how about a can of worms ?? You did purchase the program.. you should be able to run it.. If someone were to hand you a version that had to protection removed would you have the right to own it ??? I know that that version would violate copyrite laws because it was modified

but then you did pay to use the program..If a developer is still in buisness with that machine I think they should provide some kind of patch for it.. even if it costs a few dollars.. Or I am sure they have a non protected copy that could hve a differnt copy protection put on it..
I ran into the same problem with a program and posted a message stating my problemm.. the users seemed to say keep it,, and developers and such did not say anything ???

Here's how it works:

K&R: floats are passed as doubles
ANSI w/o prototypes: floats are passed as doubles
ANSI with prototypes: floats are passed as floats

Sozobon is not ANSI, so floats are passed as doubles.

>to read format and write the tracks.

Obviously it goes a lot quicker to format the track and write the track data at the same time. This cannot be done using the xbios format routine so you have to program the FDC via the DMA yourself. It doesn't make formatting any quicker but there is less time wasted on other things. If it is an important backup (as opposed to mass copying) you will also need to verify the data.

UE> Sozobon is not ANSI, so floats are passed as doubles.

Except that Sozobon doesn't have doubles. Yes, it does have the `double'
keyword, but doubles are just treated as floats. If I remember correctly,
it even assigns only 4 bytes.

I vote for the inclusion of real doubles in the next release of Sozobon. It
could just use the GCC floating point library, so it would be very little
work (except maybe for the bootstrapping phase).

>where to get it: Prentice Hall

Almost corrrect Harold,

Price is US $ 169,--
You can use minix on a system without hard disk. Some extra memory or
two floppy drives are then *very* nice to have, in order to
avoid extensive disk swapping.

Note that single side disk drivers are supported but that, in order to
read the distribution disks you'll need a double sided disk drive.

In comp.os.minix there is an infosheet and a list of frequently asked
questions posted at regular intervals. These contain more details and
ordering addresses in various countries.

Happy minixing!

Why copy it anyway? Renaming the files is faster and the files don't move
around over the floppy/harddisk which could slowdown booting considerable,
if your files are spread over many different tracks.

3799. Priam drive installation

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-28 16:27:57 UTC
From: "Daniel Koppen"
Message-ID: <1991Oct28.162757.21743@news.larc.nasa.gov>
Source record: 46789

Hi netters,
Recently, I got interested in upgrading my hard drive from
85 Mbytes to 300 Mbytes when I found an add for someone selling
Priam 730 (or is that 738) SCSI hard disk. I currently own an
ICD FAST drive mechanism with a Seagate SCSI 85 Mbyte drive
(I forget the model number) inside. I have the most recent ICD
drivers (from attending the WAACE show a few weeks back), but
as near as I can tell, there is no information about the Priam
in the data file.
Has anyone put a Priam drive in their Atari? Can anyone supply
me with the head and cylinder count as well as a recommended
interleave? Can anyone think of any other infor I will need to
make this work?

Thanks,
Daniel M. Koppen / Internet: dmk@air12.larc.nasa.gov

I think the current price is about $170 now.

Well, our news reader won't reply to your Email address, so here go my 2 cents.
It should work straight from the ICD software.
The SCSI drives are not listed in the ICD's format info files, because they
don't need to.
The ICDFORMAT issuse SCSI command inquire the drive to supply the ID and the
drive spec.s at the time you pickk the drive to be format, so just fire up the
ICDFMT and pick that drive will display the necessary informations.
If the ICDFMT did show the drive then you might have connection problems.

3803. Re: Archive Bit

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-28 19:57:05 UTC
From: apratt@atari.uucp
Message-ID: <1991Oct28.195705.22049@atari.uucp>
Source record: 46645

rjwalsh@unix2.tcd.ie (Robert Walsh) writes:
>What is the archive bit in a file?

It is set when a file is created or changed, and never cleared by the OS. The idea is that a backup or archive program can clear the bits of those files it archives, and thus any file with its archive bit set has NOT been backed up.

This is not quite true under TOS: before TOS 1.4, the archive bit was pretty much random. Starting with TOS 1.4, the archive bit is set by TOS any time the directory entry needs to be updated -- when the file is created or lengthened. If you change a file in place (i.e. a database file in which you update a record without making the file bigger), the archive bit is not updated. This is not necessarily desired behavior (i.e. you can consider this a bug if you want).

This is correct. It is possible to write the data in the format pass.
However, in doing so you are dealing directly with the ACSI DMA chip, the
ACSI bus, and the FDC controller. This means you are totally on your own
as far as compatibility goes: you can't come crying to us when your program
doesn't work on some machines, on a future machine, or with some version or
other of the OS.

I doubt very much that *any* disk operations would be significantly
slowed down by such a TSR. Remember, the disk I/O time so totally
dominates the time it takes to do an open() (or pretty much anything
else on disk) that a simple string comparision and possible
replacement is comparitively negligible. It certainly wouldn't "slow
access down like molasses"; I doubt it would be more than a 1%
performance hit (maybe a bit higher for a ramdisk, but still not
noticeable to the user).

Message-ID: <1991Oct29.012532.14187@csl.sri.com>
Source record: 46647

Here's the long and the short of it, I am a very happy Spectre GCR (3.0) user, but I don't like trips to a local copy center to pay high per page prices for laserprinters that are dirty (It is illegal for me to use University Computer equipment for personal profit). Since I (and my wife) do a bit of DTP work on Spectre, I was pretty impressed with the Apple Stylewriter 360 DPI printer, especially with its student price. Anyhow, I've got it home, I just need to get it to work. I have used a standard MAC DIN-8 to DB25 serial converter, direct into my ST serial port to no avail. If anyone has had experience using the Stylewriter with Spectre (or anything else, for that matter) please drop me some e-mail, especially if you have a cable diagram for the cable you have used.

Thank you...
-Bill Mills

NOTE: Since posting access at my site is temporarily down, I am having a friend post this. PLEASE respond directly to me by e-mail, not through rn (or whichever news program you are using).

3808. ST enhancements

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-29 05:32:40 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <15472@uhccux.uhcc.Hawaii.Edu>
Source record: 46649

I attached a National Semi. DP 8490 SCSI chip to my STe DMA chip and while I can verify successful writes (by checking the programmed states of the pins), attempts at reading data from the 8490 only results in 'FF' data. Memory mapping the 8490 at $D00000 also gave similar results (writes are okay, but reads are random junk). Can anyone familiar with the DMA and the ST(e) bus give me clues about getting the chip to read correctly?

The N.S. databook gives these specs for the 8490:
min max (ns)
address hold from end of read enable (*RD) 5 -
" " " " " write " (*WR) 5 -
" setup to read or write enable 5 -
*CS hold from end of *RD or *WR 0 -
data hold from end of read enable 20 60
microproc. hold from end of *WR 10 -
data valid from *RD - 50

The databook notes that read/write enable means either *CS and *RD or *CS and *WR.

The DP 8490 is a CMOS chip that is software/hardware compatible with the NCR 8530 and also provides features and bug fixes that makes it 10-15% faster than the equivalent NCR chip. Two 8490s connected over a 3 meter SCSI bus are supposed to be about 90% faster than two NCR 8530s similarly attached. The 8490 also costs only $11.25 from Arrow Electronics (quantity one) and a kit of parts fitting on a 4"x4" board mounted below the floppy drive would cost about $10-$20.

Another relatively cheap enhancement for the ST is the addition of a Yamaha YM 2203 FM synthesis chip. It should be cheaper than the $35 for the 2203 plus $8 for the YM 3014 13-16 bit D/A converter, but Yamaha seems to be limit-its distribution because they are worried that it would hurt their synth sales! (The Soundblaster Pro is said to have a better Yamaha FM synth chip which might work well with the ST computers too.)

The 2203 is software compatible and can boot up my ST, but since the chip is more expensive than the PSG, it would be better to keep the PSG and add as many 2203s as you would like to decode. Although the PSG side of the chip works okay, I haven't been able to listen to the FM voices because I suspect the D/A chip is faulty. If anyone else has tried out the 2203, please send me a note.

Also, since a board with several 2203s would cover the MFP chip, I was wondering if it was possible to add more MFP in a daisy-chained fashion

as mentioned in the ST Internals book? They cost around $9 each, but I'd like to know if they are available cheaper.

Since my STe power supply bonked out after 48 hours of use and it was replaced with an external supply (now the STe runs very cool), the space left seems like a good place to put some type of graphics board. One graphics chip made by Inmos is the IMS G300B/C with these features:

video rates up to 110 MHz
interlaced or non-interlaced video
generates studio braodcast standard sync signals
1, 2, 4, 8 and 24-bit pixels
on-chip triple lookup table
triple high-speed 8-bit video DACS
general purpose video RAM support
available in 84-pin PGA package

Is it possible or practical to install a board with the G300 in a 1040 STe?

Also, Yamaha has introduced a set of graphics chips that achieve the equivalence of high-performance (w/ high price) graphics workstations. They are called the GC (or CG?) 1201/1202/1203 and can supposedly do around 1.2 million vectors/s with 70,000-100,000/s 2D/3D polygon shading. (I'm not familiar with the graphics benchmarks, but I saw an ad for an IBM 730 POWERstation that said it was capable of 1 million 3D vectors/s)

I think the basic chip set costs around $500-$1000 and an evaluation board for PC-AT and VME bus computers is available. The price for the chips is supposed to decrease by 60% once production is ramped up. If someone can port it to the Mega STe and TTs, it would make them pretty desirable machines!

Thanks,
Jack

Since Atari decided on a VME bus for the TT and Mega STe machines, I would like to know more about it. What are the dis/advantages of the VME bus?

Someone said it was capable of 50 MB/s and I know that the PC ISA bus is only about 4-6 MB/s, the EISA peaks at 33 MB/s, Mac NuBus at 10-20 MB/s?, the Amiga 3000 and NeXT at ? MB/s.

Thanks,
Jack

The "Chip Merchant" here in San Diego County seems to have the
best prices that I've seen anywhere - as of October 25th, they want
US$29.00 for a 1MB 100ns SIMM, or $3.90 for 1mbx1bit chips, which is
what you need, I believe. Their number is (619)268-4774, FAW
(619)268-0874. (that's FAX, not FAW!).

Tell me why does Atari give out all the Data on programing the DMA ic,
and also the FDC in the Developer Note's, if they did not intend that
you could program it..

Or is it that Atari have now changed the rules again..

Like they did with Line A calls..

In <rjwalsh.688580903@unix2.tcd.ie>, Robert Walsh writes:

Hi,
>What is the archive bit in a file?
at first, the archive bit is not stored within the file, but within the file's directory entry (byte 11, bit 5).

When using TOS 1.04 or higher, every time you modify a file (to be precise, if you write to it) the archive bit is set by TOS. A backup program can use this and backup files only if their archive bit is set (so called incremental backup).
Unfortunately, the handling of the archive is incorrent when using TOS 1.00 or TOS 1.02. In this OS versions, the archive bit is cleared when writing to a file.

Fell free to ask if something ain't clear...

>
>As for bytes dropping, I don't know about this. anyone else?
>
Bytes that come in via the MIDI port can be dropped if the ST is busy
servicing another interrupt with the same or higher priority than the
MIDI interrupt. The keyboard/mouse interrupt is such an interrupt. As
MIDI bytes come very fast, you may only have an interrupt latency of
about 300 us. Unfortunately, sometimes the interrupts caused by mouse
movement or keyboard hits will cause a latency longer than 300 us.
In some documentation (I don't know if it was Atari sanctioned or not) I
read that if you install your own mouse handler, you should return from
it within 1 ms. This is fast enough not to miss keyboard or mouse
interrupts, but definitely not fast enough if you have fast midi
interrupts. The only possibility would be to rewrite the keyboard
interrupt routine in such a way that it would enable midi interrupts,
but alas, there is no portable way to do so. (At least, I couldn't find
one, and I _have_ tried!). I made a simple network over MIDI, but if one
of the nodes uses the mouse heavily, it is almost impossible to use it,
because of this bytes dropping.

>
>Like they did with Line A calls..

Atari is obviously caught in a bit of a bind. On the one hand,
compatibility requires that programs obey the rules. On the other
hand, TOS is deficient in many ways, and certain things can be done
only inefficiently or not at all when sticking to the rules.
Simultaneous format-and-write is just one such example. Developers
are caught in the middle, being forced to choose whether to implement
features that users want (and that ultimately result in software that
sells machines) or to play by the rules and achieve compatibility and
much simplified maintenance at the price of lackluster performance.
Allan Pratt's repeated exhortations to be good and play by the rules

fail to address the very real dilema of such situations.

No one can foresee how a system will evolve or anticipate all of the functionality that might eventually be desired. The problem with TOS isn't so much its present shortcomings as the lack of support for evolutionary change. Even if Atari could be convinced of the desirability of a format-and-write BIOS call, the lack of a convenient way to retrofit old versions of TOS to accommodate such a call would mean that developers still could not write their applications to rely on it. A well thought out plan of disk-loadable extensions and modifications to TOS might be one approach to alleviating this problem.

3816. SCSI inquire

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-29 18:36:48 UTC
From: bill@mwca.UUCP
Message-ID: <1935@mwca.UUCP>
Source record: 46656

Does someone have a code fragment or (ideally) an entire utility which will inquire of my SCSI drives its parameters? I think I've got the wrong number of cylinders in my format parameters (using Supra s/w with BMS controller), and it strikes me that the most accurate way to be sure I have the right numbers is to ask the drive.

Alternatively, if anyone has definitive specs for the Micropolis 1375 I'd be happy to hear them...

>
>PS: Yes, I am useing even address...
>
>Stuart Carter
>University of Louisville
>Physics Dept.

Your timing sounds about right. The floppy rotates 5 times/second.
Formatting each track requires 3 rotations (I think): 1 to format the
track, 1 to verify, and 1 to move the head to the next track.
Actually, moving the head is pretty quick, but it is presumably just
long enough to cause the timing mark to be missed, forcing you to wait
for the disk to come around again. Using these numbers, 10 tracks
would take 30 rotations or 6 seconds, as you have observed.

One would think from these observations that formatting a pair of
double-sided tracks ought to be possible in only 5 rotations instead
of 6. However, I seem to recall that the Atari floppy driver always
instructs the controller to pause for a 30ms "head settling" time
after selecting a new track, even if the head does not need to be
moved. A smarter driver could presumably keep track of where the head
is and avoid this delay when it is not needed.

3819. Installing Teac 3.5 Disk Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-30 01:29:56 UTC
From: dinolt@wdl1.wdl.loral.com
Message-ID: <DINOLT.91Oct29182957@wdl34.wdl1.wdl.loral.com>
Source record: 46658

My ``trusty'' 5 year old Atari 1040ST drive is finally giving up it's ghost and I have to get a new one. I went to Fry's (our local chips store) and bought what was labelled as a TEAC 3.5" 720K FLOPPY DISK DRIVE FOR PC/XT/AT. (Once I opened the package, the drive was labelled as an ERGO MD-21 MICRO FLOPPY DISK DRIVE, ND-21-DS350-B1. I removed my old drive and connected up the new one. I tried various configurations of the jumpers, but the drive didn't respond. The motor starts up and stays on continuously. Under certain configurations the disk light comes on and stays on continuously. The red light on my ST fires up and stays on continuously. My desk top eventually appears on the screen but, of course, I cannot access the disk.

There has been much discussion, on and off, about installing non-atari drives and the changes that might need to be made. I, of course, never saved any of this. I would appreciate it if someone who has installed similar drives would tell me how they did it, I would appreciate it.

Thanks. George Dinolt (dinolt@wdl1.wdl.loral.com)

3820. Tar to SCSI tape source

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-30 03:10:13 UTC
From: paulm@dorjam.UUCP
Message-ID: <150@dorjam.UUCP>
Source record: 46664

I don't read much of the Atari ST stuff anymore, but today happened to
brows through the c.s.a.s.t group and found some intrest in my ST tape
driver and tar program. Since I bought a SUN 3/50 and now my ST is
either used as a terminal or games machine for my kids, I no longer
have a hard disk on the thing. However, I did backup all my stuff
using my tar stuff and tomorrow I'll go through the tapes and locat
all the stuff I did, source and binaries and if small enough, I'll
just post it in this group for all to do whatever with. The driver
is for a Cypher CT540 SCSI tape drive via a host adapter from an SH204
hard disk drive. The host adapter was address to the #2 DMA address.

I can be reached at (714) 772-3983 or UUCP: ..!ccicpg!dorjam!paulm
If I don't get flamed for sugesting the posting of my stuff here

I'll assume it's OK and do it.

P.S. Shoou-yu tang, you're right, I no longer work at CCI, ICL or what
ever they're called now. (Talk about an identity crisis!)
'ccicpg' is still in my path however.

Source record: 46657

Shalom,

at the SYSTEMS in Munich last week I spoke with OR. They said most of
their cards would work with the TT slot, but for some cards the VME-BUS
of the TT has not enough power. VME said there should be about 4xx mA
available but Atari only gives about 200 or 300 mA. For some cards
thats not enough power.

And I heard of problems with some cards because the TT slot is made in
metal so there might be short circuits with some cards.

so long

It is much easier to modify the parallel print cable by inserting a
diode in one wire. I did this long ago (and so don't remember any
details - but I saw the modification on GEnie). It works great. I
can turn on my DeskJet 500 at any time and my 1040St w/TOS 1.4 will
see it. Been working fine for a long time now. IMHO, this is the
way to go.

Wouldn't it be nice if all GEMDOS calls were vectored through RAM so that an individual service could be modified without having to take over trap #1! Lacking that, wouldn't it be nice if Atari would release a standard trap handler written by an experienced 68000 programmer that we could all use.

Perhaps the solution would be a trap #1 server that would copy the jump table from ROM into RAM and install itself in trap #1. Client program could check the cookie jar to see if it was installed and if so, simply modify its jump table instead of installing yet another trap handler. For this to be successful, clients should follow an XBRA-like convention when linking themselves into the chain for a given GEMDOS routine.

Anyone feel like suggesting a standard and producing the necessary code?

Try turning the 34 way connector over..

Note: 3rd party drives generally don't recognise a disk change, and
even some Atari ones.

Try setting the write protect notch on and off while changing the
disk each time, use the Esc key and see if it re reads the disk each time..

Some will do it with the disk protected but mustly don't when the
disk is write enabled..

I think that there is some software to fix this.

>Can gulam be made to use the small system font? If so, how?
>Thanks for any replies.
>

Here it is, right from the Gulam manual:

------

`nrows: unset'
This variable controls the number of lines per screen. At present, only
valid values are 25 or 50. Changing `nrows' to 50 will cause the
re-initialization of the screen using the small system font.

------

So you can just type "set nrows 50" to switch to 50 line mode (or the
small font). Many programs unfortunetely assume there are 25 lines on the
screen (less.ttp is unfortunetely one of these), so they only use the top
half.

>an atari 1040ST. Which sort of hardware is needed, where can i find it ?

Yes, you generally can. PC type drives can be hooked to an ST by using a
SCSI controller board (like the Adaptec 4050A). This is the way it works.
The ST talks ASCI to the host adaptor. The host adaptor converts it to
SCSI, and talks to a SCSI device. The SCSI device can either be embedded
(in which case the drive has it's own SCSI controller), or it can consist
of a separate controller board and drives. You end up losing some in
performance (embedded devices are usually faster), but if you already own
the PC type drives it might be cost effective. I know of no way to use an
IDE drive, but MFM and RLL drives should work fine.

Straight embedded SCSI is cleaner, and the devices have fallen greatly in
price. If you are buying new, you might want to go this route.

Well there I am again , looking for a UUCP package ...
does anybody have a UUCP package in which both uucp and uucico allow the user
to retrieve files from a remote system ??
I have Mercury but it doesn't.
Few days ago someone talked about a Hermes package , could some one give me
his address so I can send him a disk ?
I'm kinda frustrated , I have the GNU-UUCP sources but cannot compile them !
I'll send them in when sending the disk for Hermes
so maybe someone will be able to do the porting/recompiling of this stuff !

Renaming is certainly faster, but then you lose the identity of the file:
e.g. rename DESKTOP.MED to DESKTOP.INF, then rename DESKTOP.LOW to
DESKTOP.INF -- DESKTOP.MED is gone.

Copying such a small file takes << 1 sec. and I doubt that it contributes
much to disk fragmentation.

If only we had symbolic file links...

Source record: 46666

A few questions:

(1) (to the MS-DOS experts) What is the number of sectors/cluster for
STANDARD MS-DOS HD disks?
(2) GEMDOS used to support only 2 sector/cluster. Has this changed in
the newest version (GEMDOS version 0.20 in TOS 3.06)?
(3) What is the max. number of clusters supported by GEMDOS?

One more question related to this theme:

Discs formatted with DOS 5.0 have an entry "FAT12" in the boot sector.
Am I right that ED discs will show "FAT16"? In this case these strings
are intended to signal the fat format, i.e. 12 or 16 bit fat. What about
harddisk partitions? Do "FAT12" and "FAT16" exist there, too?

>it even assigns only 4 bytes.

Well, that shows how much I have used the floats in Sozobon C. I doesn't
matter though for what I wrote above: if floats and doubles are identical
in Sozobon C, then floats are in fact passed as doubles, just like they should.

Isn't it in fact perfectly allowed for a C compiler to have identical
floats and doubles?

>I vote for the inclusion of real doubles in the next release of Sozobon. It
>could just use the GCC floating point library, so it would be very little
>work (except maybe for the bootstrapping phase).

I think I saw in the Sozobon docs that the floating-point code was just
thrown in as better than nothing.

>programmer that we could all use.

Funny, I was just thinking about this very thing the other day...

However, I can hear Atari screaming at us right now - that this
would require ROM-dependence... Well, perhaps it would require some
voodoo on present ROM sets, but they're set in silicon - maybe
future TOS versions could include a function that returns a pointer
to the jump-table.
>

Sounds good!

>
>Anyone feel like suggesting a standard and producing the necessary
>code?
>--

This sounds like something interesting to try, but I fear that
unless it is produced by one of the "Gods" it might not gain
widespread acceptance. Some pre-written library routines are a must
(in C, GFA (can you write TSR's in GFA?), Assembly, maybe even
Pascal). I don't want to sound like I'm making an imposition, but
maybe somebody at Atari could take this on - that would certainly
make it canon enough for mee!

3836. Autorun low res

Newsgroup: comp.sys.atari.st.tech
Date: 1991-10-31 19:59:20 UTC
From: bill@mwca.UUCP
Message-ID: <1936@mwca.UUCP>
Source record: 46672

While trying to reconfigure my system using Superboot to autorun Railroad Tycoon I've rediscovered some wierdness I hadn't previously solved. I've a one meg TOS 1.4 520ST.

Quirk #1: I've set up a Superboot function key to autorun Railroad Tycoon in low rez. The system boots but puts me at the desktop rather than autorunning RR Tycoon. If I view the DESKTOP.INF the first line is the "#Z..." thingy with the proper filename and path for RR Tycoon, so the line is being inserted by Superboot to RR Tycoon. I don't believe I've ever gotten an autorun to work in low rez, they work fine in med or high rez. Any ideas?

Quirk #2: When using the raw desktop (I usually use Neodesk) I've found that I'll eventually get "invisible windows" - that is, after exiting an application, one real window will open, and one or two "invisible windows" will open. I'll see the grow boxes, but nothing will appear on screen. The desktop thinks I have several windows open, because it will let me choose "close window" from a menu and I'll see shrink boxes, and if I try to open more windows I'll get the "too many windows open message" even if there are only two or three visible. This is rather annoying, but sounds like it may also be related to DESKTOP.INF.

Any ideas? Might Superboot (I'm using the latest version, and am registered) be writing an improper DESKTOP.INF?

Please post or email any help. Thanks.

You know, the late revisions of Megas have this little board
with a logic-chip located on top of the MC68000 and soldered to pins 12-18.

Where and how do I connect this little thing, when I am
installing a 16MHz 68000 accelerator to my Mega???
To the matching pins of the new CPU? To the same points as it was with
the old CPU? Something else?

The installation manual does not mention anything about it...
(we are mainly talking about the board made by CMI. But general
instructions are most welcome)

BTW, what does this funny little thing do? A correcrtion to
some nasty lay-out error?

From: ee89jet@brunel.ac.uk
Message-ID: <2805@mercury.brunel.ac.uk>
Source record: 46681

Hi,

I have recentely brought a 2nd hand Modem (a WS4000 v21/23, made
by mircale technology). The lead from the modem to the computer
is terminated by a 50 way SCSI socket, and I'd like to able to
connect this to the RS-232 socket (I understand this is a 25 way
female D-type) of my 1040STFM. Do I simply make up a cable where
pin 1 -> pin 1 of RS232 (i.e. 1 to 1)?

I would really appreciate some help on this, from anyone who has
a modem, and anyone with a WS4000 would be especially welcome!

Thanks in advance,

Jon Taylor.

Source record: 46542

I am contemplating the use of a high-speed modem (9600 bd with data compression) for which hardware (RTS/CTS) flow control is strongly recommended, if not required. I have a 1040ST running TOS 1.0, and have seen casual references in the past to a bug in that version of TOS that required patching before hardware flow control would work.

Can anyone tell me if such a patch is really required and, if so, where I might lay my hands on it?

Thanks,
Steve Z

What happens when the user wants to save the desktop after making modifications? It would go to c:\desktop.inf instead of being re-routed to c:\desktops\deskhi2.inf or whatever! If you stay around that you're at least guaranteed consistency...

3850. Can I use the 6x6 font as system font in low res?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-01 18:11:39 UTC
From: bcc@Eyring.COM
Message-ID: <1991Nov1.181139.17513@Eyring.COM>
Source record: 46687

I am doing a little programming in low res, and would like to use the 6x6 font instead of the 8x8 to get a little more text on the screen. After poking around in the ROMs a little (I have TOS 1.4) I know where the different fonts are located, and I even found a subroutine which, when called with the address of the font, apparently switches to the new font. It still doesn't completely solve the problem, since the character width and height remain at the old settings, so some letters print as a char and a half!

I know that I am supposed to use some sort of VDI call to do this, but the two books I have don't make it very clear -- they curtly say that the display only allows one font.

Could I make the icon font into a system font by copying it into ram and changing a variable or two?

(Please don't flame me on portability, or for peeking into the EPROMS. I'm not trying to write this as a commercial package -- it's mostly for my own benefit.)

3851. MIDI interrupts, etc.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-01 18:28:03 UTC
From: miskinis@aidev.enet.dec.com
Message-ID: <1991Nov1.183349.27818@ryn.mro4.dec.com>
Source record: 46544

Hi,

It took me almost 3 years to learn how to get the ST to
NOT lose MIDI bytes while other interrupts were happening. I
posted lots of informational requests here, but never received
anything decent, as the code to do this is DIFFICULT. Anyone
who has done it, seems to keep it proprietary, as they most
likely work for a software company offering "pro" music
packages.

I have completly re-written the level 6 interrupt handler, which
entails handling keyboard, mouse, and MIDI.

The side effect of this, is that screen savers won't work, as they
look for mouse or keyboard data at the normal places.

My intent is to someday (hopefully soon) market something myself,
but my full-time software engineering duties don't give me much
time left for STing these days...

I've also been working on a "Motif-like" display system, as I've
got REAL bored with GEM, after working on larger systems...

It's been a bumpy road for me, but someday I'm hoping that it
will pay off...

John

I had the exact same problem when I tried to install a new 720K drive.
Another post suggested to flip the cable over. This is part of the problem,
but the other half is the following: There is a set of DIP switches or
jumpers on the back of the drive that controls how the drive is accessed on
a PC. (Or something.) Anyway, it is automatically set at the factory to
be recognized as drive 1. You want to change it to drive 0 (zero). There
should be a label or something on the back of the drive listing which
switches correspond to what setting. But, that should be your problem.
In summary: Change the setting to drive 0, and then flip the cable and
try the drive till it works!
That should do it! Hope this helps.

3854. Re: name of DESKTOP.INF

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-01 19:41:07 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1991Nov1.194107.3272@digi.lonestar.org>
Source record: 46543

In a whole bunch of articles a whole bunch of folks discuss the DESKTOP.INF file name with comments such as:

>>>>All this would be much cleaner if I could just point to one of three
>>>>different DESKTOP.INF files.

>Renaming is certainly faster, but then you lose the identity of the file:
>e.g. rename DESKTOP.MED to DESKTOP.INF, then rename DESKTOP.LOW to
>DESKTOP.INF -- DESKTOP.MED is gone.

Buy Neodesk 3. You can have as many desktops as you like, you can name them whatever you want and you can set up a macro (such as a function key) to load them on the fly. PLUS you can have program icons on the desktop (along with a whole slew of other nifty features).

(Now I hope that the original question was user related and not programming related. If the latter, please excuse the extraneous response.)

Yep, you need it. Doesn't matter if you have TOS 1.0, 1.2 or 1.4 they all
have some RTS/CTS bug. There are several fixes, I think TURBOCTS works the
best. It should be in the binairies somewhere, or any other ST-related BBS.

At home I'm using Neodesk 3.x and at the magazine I work I use a Mega STE4
with TOS 2.05 and I do prefer the new TOS. It has much functions found in
Neodesk but they are much faster. As for DESKTOP.INF (NEWDESK.INF on TOS 2.05),
you can load them after the systems boots up.

Now the news: A German company has made a little board that makes it possible
to put TOS 2.05 in a 'old' ST. This board is so good Atari approved it.
Rumers say Atari has made some special modifications to TOS to make this
board even more compatible. This board does not come with TOS 2.05 (or the new
version 2.06) you have to buy that from your dealer.

```
|> Can the IBM computer read an Atari ST formatted diskette??

The IBM can not read normally Atari ST formatted diskettes.
If you format you Atari ST disk using IBM format from c-panel
or something, both the IBM and the Atari will be able to read it.
In theory, the Atari ST can read IBM 720kB formatted disks (not
the other way around), but you might experience som problems
with this, anyhow.
So, your best bet to enable crossreading of disks, is to IBM
format on the Atari ST as described above.

Actually the modems out there will use 19200...
If you havent gotten your high speed modem yet I would suggest you get one with the minimum of v.42 bis and v.32
v.42 is the data compression and most if not all modems in the high speed range support this now..
(MNP1-5 is also nice to have but v.42/v.42bis is alot better and provides fallback to MNP1-4)
v.32 is the 9600 baud standard now.. (HST's are also heavily used but your better off getting the v.32 since most NEW purchases will be compatible with it.)
V.32BIS is the 14400 baud standard and if you can afford it I would suggest this. It is downwardly compatible with v.32 modems.. However you might be able to find someone with the v.32 format that is willing to sell to get a v.32bis modem. You will actually connect these modems to your computer at 19200 so that the full capability can be achieved. (Realize that with VERY good lines a V.32bis modem can do much higher then 19200 baud but the ST's wont without some hardware modification...)

YOu need a patch called TURBOCTS or something simular...
As far as I know only TOS 1.02 has properly working hardware handshaking.
And the latest 2.06 and 3.06 of tos.. Versions 1, 1.04, 1.06, 1.62 and pre-2.06 "2.x" versions as well as the pre-3.06 "3.x" versions had patches that were needed.

nope, less looks up $TERM, so if you switch fonts remeber to
switch the value of $TERM too. Most termcap/curses based programs (mg,
less, gnu-emacs etc) work just fine then. Something like

alias hi50 'set nrows 50; setenv TERM hiatari'

will do the trick for you in gu.prg. the $TERMCAP entry for hiatari
should just contain the usual atari entry with 'li#50' instead of
'li#25'.

cheers,

Speaking of drives, has anyone out there heard about the upgrades we MEGA STE owners are suppose to get to bring us out from the stone age of 720K to the lesser stone age of 1.4mb?

Did anyone get one, see one?

Would be nice to have 1.4Meg Spectre and MAC Floppies!!! God that would be nice...

EGADS, man you got guts! Wouldn't want to SHARE with your fellow ST people WOULD WE??!! TOS is not nice at that low of a level. Not nice at all.

Seriously though, my current handler locks out the keyboard while doing MIDI block transfers for my BBS network system, which is OK for the application but I never had the time to do what you did. Sounds like a more elgant solution, I would personally love to see it.

Man doing packet CRC checks when you aren't even sure you'll get the CRC in one piece is a REAL DRAG.

You have to rename both files, the old and the new version of your DESKTOP.INF.
(And of course only one file if there is no old version.)
> Copying such a small file takes << 1 sec. and I doubt that it contributes
> much to disk fragmentation.

If you only copy the DESKTOP.INF you don't notice much (depending on how many files you are creating during on session you may notice, that the DESKTOP.INF wanders to the end of your partition) but if you have other configuration files as well (such as an ASSIGN.SYS) this may become another factor.

3870. MiNT 0.9 is now available

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-03 18:19:09 UTC
From: ersmith@julian.uwo.ca
Message-ID: <5669@julian.uwo.ca>
Source record: 46559
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just sent the source code and binaries for MiNT 0.9 to
atari.archive.umich.edu and to the moderator of comp.binaries.atari.st.
(On atari.archive it appears in the "mint" directory; the files with
"b" on the end are binaries, those with "s" are sources; mintman.zoo
contains some manual pages for MiNT and some other documentation that
programmers might find useful.)

MiNT is a multitasking operating system (well, at this stage it isn't
a *complete* operating system, but it acts like one). It can run most
ordinary TOS programs, and also provides a number of services that
MiNT aware programs can make use of (e.g. pipes, pseudo-terminals,
user and group identifiers, and symbolic links). The new version of
MiNT has been extensively re-written in order to remove a number of
limitations of earlier versions, and so that separate stand-alone
file systems can be used to extend MiNT. A sample file system that
can read Minix format disks is provided with MiNT (this was contributed
by Stephen Henson). The new file systems can provide both hard and
soft links, and can put restrictions on which users can access which
files. (Alas, the default TOS file system can't do this; it would
certainly be possible to write a replacement that could, if someone could
figure out a sensible way of stuffing permission bits into TOS directories.)

TT owners will also be relieved to note that GEM now works correctly
under MiNT, and that the new version of MiNT supports the extra serial
ports on the TT and has code for saving/restoring the FPU registers.

Many thanks are due to Alex Kiernan (who provided the FPU code and
ported MiNT to Lattice C) and to my beta testers: Jwahar Bammi, Dave
Gymer, Stephen Henson, Allan Pratt, and Stephen Usher.

>
>Well there I am again , looking for a UUCP package ...
>does anybody have a UUCP package in which both uucp and uucico allow the user
>to retrieve files from a remote system ??
HERMES does this very well. You can use the 'uucp' command to write a
workfile-line for the uucico, which is already able to send the request-
command to the other side of the line. I use this weekly to get some index-
files from my host.

>Few days ago someone talked about a Hermes package , could some one give me
>his address so I can send him a disk ?
I already sent the package to someone in the U.S. to publish them on
c.b.a.s. You hopefully won't need to send the disk. Perhaps you might
send the shareware fee to the author (No, it isn't me and I haven't
seen him ever :-)).

>I'm kinda frustrated , I have the GNU-UUCP sources but cannot compile them !
>I'll send them in when sending the disk for Hermes
You should not try to compile the gnuucp sources, because they are even
badder than our GFA-cico. The gnuio doesn't support windowed transactions,
so you would get very slow connections. Our 'cico' doesn't run under mint
or other environments, but all other things are done perfectly.

Bye.....Michael

TOS 1.4 and higher formats diskettes that can be read by IBM-clones.
What Mr Larsen writes apply only to TOS 1.0 and 1.2.

3873. TT Simm question

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-04 02:01:36 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1991Nov4.020136.16817@magnus.acs.ohio-state.edu>
Source record: 46562

Hello, all.

I'm looking/thinking/hoping to get a TT sometime in the not too
distant future. That is why I am asking this questions now.

I have heard that the TT can be expanded using 4 megabyte simms to 26
megs. My question: What are these simms like? What are their specs?
What do they look like? Any information would be helpful.

You see, I have access to some 4 megabyte simms, but only for a
limited time. I might not have my TT before that time expires. So,
if these simms fit, I'd like to get them now.

Thanx in advance.

3874. Indus GTS-100 floppy drive

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-04 02:34:16 UTC
From: boyd@mailer.cc.fsu.edu
Message-ID: <1991Nov4.023416.22063@mailer.cc.fsu.edu>
Source record: 46563
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy,

I have a been offered a GTS-100 for a song. However, it (like its brethren) does not seem to work quite right. When I connect it to my Mega2, it not only refuses to format in twisted mode, it also somehow prevents my internal from doing it! My questions are:

What exactly is wrong with this drive (ie what does it do wrong).
Is there any way I can disable or fix the "wrongness"?

I remember this thread from years past, but time has clouded my memory. I want the drive to work with my system (obviously), be able to format out to at least 82 tracks 10 sector/track, and be able to twist format. I assume there is something non-standard with the Indus board in the drive, and not the drive mech itself. Could it be an internal cabling problem? I would not hesitate to rip it apart and fix it if I knew what needed tweeking, nor would I care too much if the little digital track display was lost in the process.

The drive mech inside is a Shugart SA310-16. Can anyone tell me if this one will work ok with the ST (ie no media change problem)?

Related to this, is there any document which outlines the method of hooking a generic 3.5" drive to the ST? I seem to remember that this only requires a special cable. Could I hack the drive cable and connect it directly to the mechanism, thus ignoring any Indus specific hardware?

Any information would be appreciated. Please email, and I will post a summary if there is interest.

Source record: 46569
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just recently bought a TT and I've had it for a couple weeks. For some reason the sound no longer works. Nothing I do will make the sound come back on. I've tried the control panel, I've tried every program that has sound effects or music. Nothing works. I'm very upset. I've only had the thing for a couple weeks and already it is broken! If anyone has had similar problems and knows how to fix this please let me know, and if anyone from Atari is listening, I'm beginning to lose my faith after spending tons of money on a computer that isnt realiable.
Bill

3876. Ack! STe DMA sound problems?

Newsgroup: comp.sys.atari.st.tech

From: atilghma@sdcc13.ucsd.edu
Message-ID: <25201@sdcc6.ucsd.edu>
Source record: 46568

I'm having problems playing digitized sounds on my STe - not .MODules, just .SND files that have been sign-converted... It seems to be a constant 2.2-second disruption at the beginning of each sound [I tried both Aaron Naas' "EPLAY" and another program called "STESOUND.PRG" - both have the same problem] and this disruption makes my computer sound like it's dying!
After this little disruption, the sound comes out fine... And whenever I play MODs via either "STEPLAY.TTP" or "JukeBox" they sound fine. What gives?
My system configuration is TOS 1.62, 1040STe purchased in August, 4Mb of 100ns RAM, a DEKA keyboard adapter, and an ICD Hard Disk [the rest is fairly standard] - is it dying?

3878. Re: RS232 Hardware Flow Control: Where is TURBOCTS?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-04 11:24:14 UTC
From: rriesen@hydra.unm.edu
Message-ID: <1cmd2x-@lynx.unm.edu>
Source record: 46564

I have been following the thread about RS232 hardware flow control with great interest. Whenever I receive loads of data (e.g. graphic commands to my tek40xx emulator, or long lists) the output suddenly stops. I then hit the return key and get my prompt back; i.e. all the data between the stop and the prompt has been lost.

According to the above thread I need TURBOCTS. I have been unable to locate it (Neither CompInd on atari.archive nor archie know about it). Can somebody tell me where to get it?

At home I use an Atari 1040STf (TOS 1.0) with a 2400 Baud V.42bis Zoom modem. Curiously enough, the same thing happens at work with a 80286 and an internal Hayes V9600 modem. This seems to indicate that the problem is not within the Atari. (At both places I tried all kinds of settings and different destinations.)

Thanks for any help and hints. Rolf

Yes sir! There is a small board for STfm and STe sold by ARTIFEX in
W-6000 Frankfurt/Main (F.R.G) which contains an extended ROM and
TOS 2.06 . Costs 198 DM. But Overscan didn4t work with it (29/10/91).
And you need to have space in your old tightfit B-) Atari box.
So if you are using an accelerator board or have added memory, you
should check first with ARTIFEX or your Atari dealer (=pusher B->)
before purchasing it.

I think in MiNT there is such a jump table - even for trap #13 an trap #14
Just call trap #1 (or trap #13, #14) with $FFFF.W on the stack, and you
will get the pointer to this table.
Maybe a non-MiNT trap-server could let you do the same...?

Perhaps I should have mentioned that these sounds sound fine when
played through the GI chip - PlayIt, et al. I even wrote a program
which padded the beginning of the sound file with 30K of "0" bytes,
and I STILL got the burping noises [perhaps I should digitze them
and post them to thenet? :-)]

There's a PC program called FDread that makes the PC read all sorts of
disk formats, including 'old' ST disks ('new' disks are formatted to be
readable by PCs anyway).

FDread is part of the PD FDFormat package available at many servers.

>This is correct. It is possible to write the data in the format pass.
Alas, this is only part of the truth. The problem is, that not all byte-values can be written during format, as some are used as control codes to the FDC. E.g. 0xF5 writes 0xA1 with missing clockpulses, used for synchronization, and 0xF7 writes two CRC checksum bytes. A lot more about this subject can be found in the book 'Scheibenkleister', by Claus Brod and Joachim Stepper. Almost everything you always wanted to know about mass storage on the ST is in it... in German. With the book comes a disk with programs, one of which is a _very_ fast formatter. Formats both sides of a track in one(!) revolution. There is a catch to this: these disks can only be read after being written to, as the checksums are incorrect. But I think that there cannot be a faster formatter.

3886. Getting composite sync from ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-04 18:43:08 UTC
From: mathew@mantis.co.uk
Message-ID: <LuHwaB1w164w@mantis.co.uk>
Source record: 46578
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a TV which will take an RGB signal. However, it requires a composite sync. According to the documentation I have, the ST produces a separate horizontal and vertical sync.

What's the simplest way to produce a composite sync from the separate signals? The sync should be -ve, which I gather is the same sense as the ST's output signals.

Replies by mail, please.

mathew

Hi folks!

My friend has got an old Atari 520ST with external drive and it
will not boot. The disc spinns in the drive but the Atari don't
seem to get any information from it.

Is the WD1772-PH floppy controller damaged?
What is the M53206P chip?

It also seems that the r/w head doesn't move. The drive is new.

Please mail me, if you can help.

Rgds, Ari.

Hello,

I am in the process of acquiring an Adaptec 4070 HD controller and either a 32 or 65 MB Seagate RLL HD (I forget the numbers...). Anyway, I don't think the person I am buying these drives from had an ST (of course I didn't ask him before I wrote this...). Is there only one type of Adaptec 4070 controller or and if so, this is an RLL controller right??? I'm planning on putting the new (used) drive and controller into my SH204.

Also, I have an original style ICD Host Adapter connected to a Seagate 296N imbedded SCSI drive. How do I go about connecting my SH204 through daisy chaining so I can use both HD's??? Is it just a matter of chaining the DIP switch inside the SH204? (Of course I haven't tried it yet either...)

Thanks in advance,

Dom

3889. Large format graphics on the ST (specifcally .GIF).

Newsgroup: comp.sys.atari.st.tech

Hey,

Has anybody out there ever heard of or seen a program that will take large format pictures (like .GIF's) and let you scroll around to get a good look at the whole picture? A great idea would be one that scrolls the screen around at say 320x200 resolution and when the mouse button is pressed turns shows you the picture as a Spectrum (or TT style if on a TT ;-) picture. Then you could either scroll around some more or save the picture shown.

Does a program that does anything similar to this exist?

Dom

3890. GDOS & SHEL_WRITE

Newsgroup: comp.sys.atari.st.tech

Yes - as I recall, the gemview accessory does this - I tried it out on my
1040ST/mono some time back: the picture comes up in a standard GEM window,
and you can use the scroll bars to see the edges that ordinarily are off
the edge of the screen. I didn't keep it around (lack of GIF files), but
I believe you can ftp it from atari.archive.umich.edu.

From what I think I have read, SIMM's come in a variety of flavours,
you could have the Strawberry one, but I think that the 'TT' needs
the Lemon one..:-)

It also need a custom nut, no ! not walnut but beware of the thread .:-)

Hello,
I think of either upgrading my Mega ST2 with a Hypercache Turbo+ and internal
Hard Disk, or selling the thing and buy a STE. Would cost roughly the same.
Does anybody out there have some performance data comparisons ST+T16+
against a regular STE ? Quick Index values would be fine.
Related to this : * is there a Hypercache Turbo+ version for the STE ?
* is there a AT Speed C16 version for the STE
* if so, can both be installed together ?
Thx for your help

d> following info it would

I have been demostrating the ST Notebook at the Efficiency Fair in Amsterdam a few weeks ago, so here is some info:

The computer is a Mega ST, so it contains a real time clock and a blitter chip and a MC68000 on 8 Mhz.

System Concept: - 1 or 4 Mb low power Pseudo-Static RAM
- 512Kb ROM containing TOS 2.06
- Blitter Chip
-
Expansion Bus: - 120 pins full-function expansion connector
Lines connected to the bus are: ROM lines, RAM address lines, all MC68000 CPU lines, bus control, interrupt control signals and a set of internal clock signals. Also all the signals of the Cartridge port are there. I guess this is the most powerful thing of the Notebook, when exploited fully. Interfaces can be connected and screwed onto the computer. Using these connections one could think of cartridge ports, RAM expansions, ROM modules, etc.
Resolution: - ST Monochrome, 640 * 400 pixels
Sound: - Programmable Sound Generator (PSG) with three channels
Interfaces: - MIDI In (Mini DIN)
- MIDI Out (Mini DIN)
- RS232 (9 Pins)
- Parallel
- High Density 1.44Mb Disk Drive/ACSI DMA Port. This is the DMA port in a mini version. Of course hard disks, laser printer, CD Rom, etc can be connected, but also HD Disk Drive.
Hard Disk: - 40, 60, 80 or 100 Mb 2.5'' 19ms Hard Disk (Connor) connected by using an AT port connection.
Keyboard: - 84/85 keys, 10 Function, 4 cursorkeys. By pressing a special key one can use the uiojklm,. keys as the 789456123 keys. A keypad can be connected. A mouse and joystick can be connected to this keypad.
Mouse: - Build in pressure sensitive VectorPad using FSR

technology.
LCD: - 640 * 400 reflective STN
System Software - TOS 2.06 Operating System in ROM
- File Transfer utility in ROM
- Personal Organiser (Agenda/Calender/Address) in ROM
- NewDesk desktop
Size: - 21.5 * 29 * 3.7 cm (!)
Weight: - 1.9 Kg (!!)
Power: - 7 Alkaline AA batteries
- NiCad battery pack with an AC adapter. Using the Delta
V charging algorythm to lengthen the batteries life span.
The battery can be recharged within two hours while
working with the computer. So you can recharge the
battery while working with the Notebook. The battery
or the adapter also takes care of the disk drive power
supply. When using the battery pack the computer works
about 8 to 10 hours! This depends on how much the hard
disk is used.

Also a modem can be installed in the NoteBook. The modem will be placed under the vectorpad and will be a 2400 baud / 9600 baud FAX modem
When the Notebook is closed the computer first switches off it's LCD display and after a while saves it's RAM to hard disk, parks the hard disk and switches off the computer. So when you open it again and turn on the power you continue where you left off. (like with the Portfolio)
(there is no power off switch) Using a CPX you can configure the time after which the LCD display and power is switched off when the computer is not touched after x minutes. (so you can install the x) Using this CPX you also can set the power watch switch. When switched on this piece of software continuesly watches the amount of power available. When this level drops below a certain level, it warns the user. Also there is a serial port watch switch. Picture this: you are wating for a serial transmission, but the Notebook turned itseld off. Normally when the transmission comes in, nothing happens, because the computer is switched off. Now, the computer switches itself on and receives the transmission.
There also is a 253Kb ROMdisk, installed as drive P. This ROMdisk contains vital utilities like the hard disk driver, FHDX, etc. For when encountering problems with the build in hard disk.

Hope to have helped you.

Greetings... - Jan -

How were these .SND files created, what sample rate are you using,
how were they sign-converted? Since other DMA sound stuff works, it
sounds like there is something wrong with the .SND files.

3901. Indus GTS-100 floppy drive

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-05 20:57:28 UTC
From: boyd@pi.cs.fsu.edu
Message-ID: <1991Nov5.155728.14096@mailer.cc.fsu.edu>
Source record: 46592

Howdy,

I have a been offered a GTS-100 for a song. However, it (like its brethren) does not seem to work quite right. When I connect it to my Mega2, it not only refuses to format in twisted mode, it also somehow prevents my internal floppy from doing it! My questions are:

1. What exactly is wrong with this drive (ie what does it do wrong).

2. Is there any way I can disable or fix the "wrongness"?

I remember this thread from years past, but time has clouded my memory. I want the drive to work with my system (obviously), be able to format out to at least 82 tracks 10 sector/track, and be able to twist format. I assume there is something non-standard with the Indus board in the drive, and not the drive mech itself. If the problem cannot be "fixed", what I propose to do is disconnect the drive cable from the Indus board, hook it directly to the drive mech, and use the Indus board only for power. This would cause me to loose the little LED track display, but I could live with that. This brings me to two more questions (given that the answer to #2 is "no"):

3. The 3.5" drive mech inside the Indus is a Shugart SA310-16.
Will this drive work properly with the ST, without media change detection problems?

4. What are the correct pinouts for directly connecting a floppy to an ST cable? Is there a text file somewhere that tells how to hook a generic 3.5" floppy mech to the ST?

Any information would be appreciated. Please email, and I will post a summary if there is interest.

|Maybe a non-MiNT trap-server could let you do the same...?

This may be okay for MiNT, for which you have the source code and may
know any side effects of whatever function numbers you may patch into,
but for TOS, it's a bad idea.

It's hard to know what internal state changes happen within TOS calls.
It's impossible to know what internal state changes may happen in
future TOS calls.

What's more, the recent DESKTOP.INF thread is not the first time I've
read inquiries about stealing trap vectors when it really wasn't needed.
Taking over OS functions is almost never an appropriate solution to a
programming problem. Do you also write
```
char *d, *s;
while (*d++ = *s++)
;
```
every time you need a strcpy()?

From what I have read most PC's can't run there RS232 port at over
19.2 kbs, even the PC has problems with this, but I did read some
thing from Hayes, that they have a TSR or some thing that will let PC's
run there coms port faster..

It's also not such a good idea for MiNT, perhaps. The observant reader of the MiNT 0.9 docs will note that the gemdos(-1) method of getting a jump table for trap #1 is no longer documented. I can think of few legitimate uses for this kind of thing, and almost all of those are better handled by writing an installable file system.

> What's more, the recent DESKTOP.INF thread is not the first time I've
> read inquiries about stealing trap vectors when it really wasn't needed.
> Taking over OS functions is almost never an appropriate solution to a
> programming problem.

What he said.

I disagree with Ken about the impact of a trap #1 handler on system performance (I still don't think it would have much effect -- I don't notice much difference with MiNT running, for example, and it's a *really* big trap #1 handler) but I agree 100% that this kind of thing should be done only when *all* else fails -- and in this case, copying the DESKTOP.INF file is definitely much simpler and less prone to potential compatibility problems.

(If you really really don't want to copy DESKTOP.INF, you _could_ use symbolic links under MiNT -- you'll have to change the boot drive to U: and set up the appropriate links before GEM runs, though. Copying and/or renaming seems simpler and doesn't require MiNT.)

3907. TOS 3.06 keyboard handler

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-06 16:33:12 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <91310.163312HAC041@DJUKFA11.BITNET>
Source record: 46597

The new TOS 3.06 has a new keyboard handler that allows entering all ASCII-codes on the keypad using the ALT key, i.e. PC-style. This was probably meant to be an improvement (although applications should be designed in such a way that kludges like this are rarely necessary - asking a user to memorize 256 codes is hardly user-friendly), but unfortunately it introduces some incompatibility with previous TOS versions in that ALT-keypad combinations no longer produce the correct scan code. Programs that used these combinations before therefore have problems now.
Now the question: Can this feature be switched off? If it can, wouldn't this be a job for the control panel? Perhaps someone has already started writing a CPX module...

3910. SCSI sectors

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-06 18:00:56 UTC
From: bill@mwca.UUCP
Message-ID: <1938@mwca.UUCP>
Source record: 46598

In my continuing quest to determine _exactly_ how many sectors my hard drive has, I've considered an empirical method: Use a sector editor (like the one that comes as part of the Supra utilities) and keep reading sectors until I get an error. Theoretically if I can read sector #40103 but not #40104 then I have 40103 sectors (plus one if numbering starts at 0). Is this a valid way? The reason I'm not sure is when I look at the hard drive specs that my preformatted SupraDrive has it says something like 40048 sectors, while I can read another coupla' dozen past that. There is a field for reserved sectors, but the math still doesn't come out right. Also, multiplying the number of cylinders times the number of heads times the number of sectors/cylinders doesn't equal either number (what the Supra formatter thinks I have or how high I'm able to read)!

I need a fairly exact count in order for the Mac OS to reformat the partition - if it isn't quite right the Mac OS will not format properly under Spectre.

Comments welcome.

> Am I being a bonehead? Arg.

****
* P O S T *
* C O D E *
* ! *
****

It's impossible to see what you did wrong if you don't provide an example. There are pitfalls, discussed below.

> And is there a way to get past the limit of the number of
> files Sozo will link? How can I write a big program if I can't link
> more than ten or so files?

The linker will read a list of filenames from a file. You also can put the files into a library and include it on the command line. I just recompiled MicroEMACS using the latter method. See the documentation for ld.ttp and ar.ttp.

Now, back to the first question.

Sozobon (actually dlibs) includes all the necessary ANSI-conformant functions to obtain a file size, allocate memory, and read the data.

There's a problem that you're likely to run into if you're working with large files.

ANSI specifies:

fread(char *data, unsigned size, unsigned count, FILE *fp)

Note that ``count'' and ``size'' are objects of type unsigned int. They are not long values. If you're reading objects where size == sizeof(char), then fread can deal with a maximum file size of only UINT_MAX, or 64K with a compiler that uses 16-bit integers.

I just looked at the dlibs sources, and fread() is implemented with int (not unsigned) arguments. This limits you to 32K. I think this is a bug, but it doesn't really make any difference, since both 32K and 64K are too small.

If you must use the ANSI fread function to get the data, you can work around this problem by reading the data in more than one gulp.

Another approach is to use the Un*x-compatible, unbuffered open/lread/lwrite functions from the library (see below) or the GEMDOS Fopen/Fread/ Fwrite macros that do pretty much the same thing. They will read/write long values.

Cut here 0/
----------0\----------

```
/*
* bonehead.c
* demonstration of reading and writing with unbuffered i/o
*/

#include <stdio.h>
#include <malloc.h> /* declare malloc, lalloc, et al */
#include <fcntl.h> /* constants used by open() */

main(argc,argv)
int argc;
char *argv[];
{

/*
* Declare local variables.
*/
long filesize; /* note this is a LONG, not an INT */
long bytes_read;
int fd; /* file descriptor returned by open() */
char *buffer;

/*
* Get the file size. fsize() is declared in stdio.h.
* A returned value of -1 indicates that the file cannot
* be accessed.
*/
filesize = fsize(argv[1]);
if (filesize < 0)
{
printf("Can't access file %s!\n",argv[1]);
exit(-1);
}

/*
* Allocate a buffer to hold the file. Note that we're
* dealing with a file size potentially larger than can be
* obtained from malloc, so we have to use lalloc.
```

```
*/
buffer = lalloc(filesize);
if (buffer == NULL)
{
printf("Can't allocate %ld bytes of memory!\n",filesize);
exit(-1);
}

/*
* Open the file. Note that no CRLF->LF translation will be
* performed by any of the open/read/write family. But
* the same would be true if we were using the buffered i/o
* family (fread, fwrite), because text file translations
* are performed only when reading a line at a time. See
* dlibs.doc for an explanation.
*/
fd = open(argv[1], O_RDONLY);
if (fd < -3)
{
printf("Can't open file %s!\n",argv[1]);
exit(-1);
}

/*
* Read the file into the buffer. Note that lread() returns
* the number of bytes actually read; if the numbers don't
* match, we have an error.
*/
bytes_read = lread(fd, buffer, filesize);
if (filesize != bytes_read)
{
printf("Read error on %s: Asked for %ld, got %ld\n,");
close(fd);
free(buffer);
exit(-1);
}

/*
* Now we have the entire file in memory. For demonstration
* purposes, we'll just blast it at the screen.
*/
lwrite(fileno(stdout), buffer, filesize);

/*
* Clean up and exit.
*/
close(fd);
free(buffer);
exit(0);
}
```

3914. Increasing memory on 1040ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-07 02:31:05 UTC
From: leslie@cs.mcgill.ca
Message-ID: <1991Nov7.023105.18014@cs.mcgill.ca>
Source record: 46608

I've been out of touch with the Atari world for about a year. Coming back to it now, it *suddenly* seems like my 1Mbyte RAM 1040ST just doesn't have enough memory for interesting things (like MiNT, gnu-stuff, etc.). I've also moved within the last year, and haven't found a reasonable Atari rep in this town.

So, can someone enlighten me as to whether it is possible to upgrade the memory on this machine? I know that you can get away with upgrading SIMMs on a lot of machines today -- replacing 1Mbyte chips with, say, 4Mbyte ones. Can I do something similar with this? Would I then have to change the TOS ROMs, or are the internals well enough behaved that they don't expect 1Mbyte to be the hard ceiling on the memory here?

If I can't change the memory, my next question may be "Can I get the Megafile 60 to work with a SCSI interface of my new machine?" :-) But I'm not really ready to cash in my Atari yet. It's a fine machine, and has always been vastly underrated.

I'd appreciate any and all responses, either posted here or e-mailed to me.

Thanks a lot,

Leslie Daigle.

>sounds like there is something wrong with the .SND files.
>- kn

The SND files seem to be fine - they were unsigned, but I converted them to signed, and they sound find, except for the first 2.2 seconds. Just to test it, I made a file of 30,000 zero-bytes, which should (in theory) make no sound. But I get 2.2 seconds of noise until the sound plays correctly (no sound played). Aargh! When I put the (unsigned) sound files through "PlayIt", they sound fine - there doesn't seem to be any MacBinary or IFF header lurking around there. [the sounds were "MUSIC.SND", which is from an old game, I think - and "CONV.SND", "now isn't that conveeeenient!"]

Well, the subject just about says it all.

I'd like to be able to write a piece of C code which finds the # of free bytes on a disk? The # of used bytes would also be nice.

Do you have to traverse the entire directory tree reading the size of each file to do this? Or, is there a better way....

Shadow uses some way of switching to it's own base page to
get memory. Perhaps Mike might describe the method if people
ask nicely. ;-)

I remember a similar discussion, where I suggested a TSR
program which handled malloc calls for all desk accessories.
Using the gem pipeline, applications could make requests for
memory from the program, which would assign the memory to it's
own basepage. I don't recall any violent objections raised to the
idea at the time, but I didn't pursue it.

>>>issue. They contain a total of 3-5 articles on how to write a CPX module
>>>including 3 or more examples.

Don't use the info in this article. It was obtained by disassembling the
modules and the Xcontrol.acc that was first supplied with the TT. They use
their own names for all the functions and data structures (at least the ones
they found :-)

If you're a registered developer, contact Atari for the xcontrol kit which
includes sample C source as well as release notes.

>Well, that's all well and good, but... what if one doesn't speak German? Is

> Where and how do I connect this little thing, when I am
>installing a 16MHz 68000 accelerator to my Mega???

If you have HyperCache from pro-VME then you just put it in your spare-parts bin. It is no longer needed because its functionality has been replaced by some extra logic on the HyperCache board.

>To the matching pins of the new CPU? To the same points as it was with
>the old CPU? Something else?

If the extra board is still needed with some other accelerator board, I would suggest mounting it underneath the accelerator board, connected to the same points. Install a pair of strip connectors instead of an ordinary socket if you need to make extra space under the accelerator board.

> BTW, what does this funny little thing do? A correction to
>some nasty lay-out error?

As far as I remember, it corrects a timing error to do with the Blitter chip, presumably older Mega STs should have the extra board retrofitted to avoid this error.

3921. Re: How do you determine # bytes free on a disk?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-07 11:47:32 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <91311.114732HAC041@DJUKFA11.BITNET>
Source record: 46603

There is a GEMDOS call that returns precisely what you need, so all you have to do is to find out how to call it using your favorite C compiler. Normally, you should write Dfree(&buffer,drive), where drive is the drive number and buffer a structure containing four LONGs. The first value is the number of free clusters, the second the total number of clusters, the third the number of bytes per sector and the last the number of sectors per cluster.

Konrad Hinsen (hac041@djukfa11).

Agreed it depends on the Atari DMA chip and the WD floppy controller command
interface, but there seems to be no dependence on OS version. Since the chip
commands are documented by Atari, I do not expect them to change overnight
so there will be plenty of time to adapt to new interfaces.

>synchronization, and 0xF7 writes two CRC checksum bytes.

Yes, I omitted to mention this. There may be a bug in the WD1772 chip that
makes it impossible to write full binary data to floppy sectors during a
format operation (I haven't tried it yet, so don't know). Since the FDC
buffers sector data in order to calculate checksums and therefore is aware
of whether header info or user data is being written, theoretically it would
be possible for any binary pattern to be included in the actual sector data
for a format operation. If this bug is present, maybe future generations of
the chip family will have it corrected (?).

Source record: 46606
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, why look a gift horse in the mouth, eh? I just wrote another program which, instead of resetting shiftmode to restore the 640x400 screen, resets line-A variables for a 1280x200 display. Unfortunately, the GEM desktop doesn't seem to like this. If I run this program in my AUTO folder I get bombs when the desktop tries to come up. If I wait and run from Gulam then Gulam works, but the desktop is still screwed up. Right now I'm using te in gulam to login and post this article...

Two things - how do I get the GEM desktop to use the 8x8 font when it booted up in monochrome, and why is it crashing? I've set v_rez_vt, v_rez_hz, WKXRez, WKYRez, bytes_per_line, width, v_cel_my, v_cel_mx, v_cel_wr (text in TOS mode works fine...), what am I missing?

From: gathings@duncan.cs.utk.edu
Message-ID: <khiekuINN86m@utkcs2.cs.utk.edu>
Source record: 46609

I have an Atari 1040 ST that is giving me 512k instead of the
normal 1 meg. I figured the MMU chip is good since
I can still access 512k. Could bad memory chips in the upper
banks be the problem? Could I replace these chips with
256k chips with 1 meg chips?

Suggestions (besides the repair shop) ?

3926. Re: TOS 3.06 keyboard handler

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-07 13:16:48 UTC
From: adamd@rhi.hi.is
Message-ID: <3830@krafla.rhi.hi.is>
Source record: 46617

HAC041@DJUKFA11.BITNET (Konrad Hinsen) writes:

>The new TOS 3.06 has a new keyboard handler that allows entering all ASCII-
>codes on the keypad using the ALT key, i.e. PC-style. This was probably
>meant to be an improvement (although applications should be designed in such
>a way that kludges like this are rarely necessary - asking a user to memorize
>256 codes is hardly user-friendly),

Minor comment: Operating systems are better suited to handle this task than
either keyboard handlers or application programs. In an ideal system both the
keyboard handler and the applications program would have access to a common
system routine which performs the task of entering tricky character codes.
Why duplicate the code in hundreds of applications when it can be standardized
in one place?

>but unfortunately it introduces some
>incompatibility with previous TOS versions in that ALT-keypad combinations
>no longer produce the correct scan code. Programs that used these combinations
>before therefore have problems now.

.... and not surprisingly so.

>Now the question: Can this feature be switched off? If it can, wouldn't
>this be a job for the control panel? Perhaps someone has already started
>writing a CPX module...

It ought to be possible to activate the feature or disable it at ANY time.
Since not all programs use the GEM interface, the switching capability should
not be restricted to being accessed from the desktop. However it is sensible
to provide a CPX module to offer the user his own individual defaults for
these settings (and similar ones).

[pre-release announcement]

I am in the process of writing an International keyboard handler which at
present is restricted to TOS versions 2.05 and 3.05 (I have yet to see more
recent versions), but eventually will work with ALL versions (at least until
TOS has been changed beyond recognition). I suspect that for 3.06 I will have
to replace the ALT-keypad code with some of my own, even if it has been made
possible to disable the feature.

My keyboard handler supports:

1) up to 5 various accents (theoretical maximum of 7) one of which is chosen
to be the main accent.

2) more than one national variant, selectable from the keyboard. Only one of
these is the system default, to be reinstalled by XBIOS bioskeys. Each

variant takes a maximum of 4kB (assuming that the same fonts are used),
most would take less space.

3) inverse caps mode in addition to the normal caps mode.

4) ALT-keypad combinations for typing in decimal, hexadecimal (and octal :-)
character codes.

5) individual activation/disabling of these various features, for personal
preference or compatibility reasons.

6) global activation/disable of all features (except this one), which includes
reinstallation of "bioskeys" keyboard tables. Therefore it should be possible
to run even the most hideously incompatible software without problems.

Since it is desirable for each user to select his own default modes, it is
my intention to also write a CPX module so these defaults can be set.

Anyone who is interested in these keyboard routines with view to being a
Beta tester should contact me by email concerning this. At present I have
been concentrating on making the best possible Icelandic keyboard for the
ISO 8859/1 character set (for example all the "deadkey" accents are fixed
on one key at present), but most of the code is general enough to handle
anything you people want to throw at me. (famous last words :-)

```
Date: 11-01-91 (14:30) Message Number: 8909
To: ALL Ref #: 0
From: ATARI CANADA Read: Public
Subject: TOS 2.06 AND 3.06 Conference: N-Atari-ST
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Information on TOS upgrades, pricing and procedures will follow
this announcement.

TOS 2.06 Upgrades - November 1, 1991

---> For MEGA STe, ST/STe*

* Atari ICON (Fuji) displayed at Boot.
* System memory check after a cold boot, pressing any key aborts test
to reduce attendant delay.
* A shrinking bar is displayed at boot, during hard disk intialization,
pressing any key aborts process and attendant delay.
* Pressing the Control key at boot bypasses autofolder preventing the
loading of .ACC, NEWDESK.INF and Deskicon.rsc files.
* Holding down the ALT key and typing a decimal number on the numeric
keypad inserts an ASCII code character into the keyboard buffer.
* Media Change detection on floppies works better, uses FAT checksums,
MS DOS 4.X serial numbers and many other features permitting superior
detection when a floppy has been changed.
* Less floppy spin-up delay in systems with a hard drive.
* Vacant drives detected sooner with quicker time-outs.
* Floppies with only one FAT are supported to allow greater
compatiblility with some DOS disk formatters.
* Serial Port functionality improved.
* Some programs that use Timer-A will work better (compatability
improvement).
* Multiple AES events when scrolling are reduced.

NOTE: TOS 2.06 for ST or MEGA ST requires hardware adaption,
Atari (Canada) will shortly announce the process for users
to upgrade. TOS 2.06 is available as an upgrade for STe
computers.

TOS 3.06 for the TT
-------------------
* High Density floppy supported.
* Atari ICON (Fuji) displayed at Boot.
* Boots up in 640x480 resolution, press ALT key when Fuji displayed
for 320x200 resolution.
```

* System memory check after a cold boot, pressing any key aborts test
to reduce attendant delay.
* A shrinking bar is displayed at boot, during hard disk intialization,
pressing any key aborts process and attendant delay.
* VDI improved for BITBLT operations.
* Pressing the Control key at boot bypasses autofolder preventing the
loading of .ACC, NEWDESK.INF and Deskicon.rsc files.
* Holding down the ALT key and typing a decimal number on the numeric
keypad inserts an ASCII code character into the keyboard buffer.
* Media Change detection on floppies works better, uses FAT checksums,
MS DOS 4.X serial numbers and many other features permitting
superior detection when a floppy has been changed.
* Less floppy spin-up delay in systems with a hard drive.
* Vacant drives detected sooner with quicker time-outs.
* Floppies with only one FAT are supported to allow greater
compatiblility with some DOS disk formatters.
* Serial Port functionality improved.
* The 68882 is now reset at boot time.
* Some programs that use Timer-A will work better (compatability
improvement).
* Multiple AES events when scrolling are reduced.

>
>--
>chanp@ccu.umanitoba.ca

Ok, well, yeah, you could traverse the whole disk, but fortuneately there
is an easier way, try this:

#include <stdio.h>

struct disk_info {
unsigned long di_free; /* free allocation units */
unsigned long di_many; /* how many allocation units on
disk */
unsigned long di_ssize; /* sector size */
unsigned long di_spau; /* sectors per allocation unit */
};

main()
{
long fs, fb, ts, tb;
int dd;

struct disk_info disk;

dd = Dgetdrv();
Dfree(&disk, dd+1);

fs = disk.di_free*disk.di_spau;
ts = disk.di_spau*disk.di_many;

fb = fs * disk.di_ssize;
tb = ts * disk.di_ssize;

printf("Disk %c: has %d bytes free in %d sectors\n",
dd+'A', fb, fs);
printf("from a total of %d bytes in %d sectors (cluster size is %d)\n",
tb, ts, disk.di_spau*disk.di_ssize);
printf("\nHit a key to continue\n");
```

```
gemdos(0x1);
}
```

I hope this works, let me know if it does, and like always if I did something stupid, someone I hope will point it out.

> Really, if you have to use CTS/RTS, you _need_ TURBOCTS.PRG

I'm using turbocts, and I've had several experiences of occasional dropped data using a 2400bps modem with LAP-M and V.42bis compression. The modem detects no errors, but zmodem (xyz.ttp) occasionally has to reposition the file pointer and resend part of a file. I've had similar reports from people with HST/zmodem and PEP/uucp combinations, and I'm beginning to wonder about the reliability of turbocts.

I've also heard reports that turbocts may muck up the system timer.

A combination of tox14fx3 and hs_fix 1.8 has been recommended to me. Does anybody have any experience with such a setup?

3933. MIDI-TT

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-07 21:45:24 UTC
From: niko@SERVER.CS.JHU.EDU
Message-ID: <9111072145.AA23130@ucbvax.Berkeley.EDU>
Source record: 46620

This is probably a commonly asked question. Which MIDI-out pins are not standard on the ST(e)? (some are MIDI-thru); I lost my little (otherwise useless) Atari-ST user manual that describes the MIDI ports, so I can't figure it out myself.

also:

Is there any place in the USA one can buy a TT made for use in Europe?

and another thing:

I want to "invest" some money on a TT. Are there any exceptionally good deals on TTs that anyone nows of? What is a good price for a TT nowdays?

3934. Gnumake under Hisoft Craft shell

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-07 22:48:57 UTC
From: dxper@dtek.chalmers.se
Message-ID: <6575@chalmers.se>
Source record: 46625
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just started using Gnumake in my system which I run under the Hisoft CRAFT shell. Previously I used the make which came with the shell, but unfourtunately I found it to be a not-so-good-version.

Gnumake seems to be working OK, but at some point I end up having a need to execute shell commands (most notably the "touch" command) but this is an internal function of the shell.

Is there anyone with inside knowledge about the Gnumake program which knows if it is possible to execute commands via the standard system() interface which CRAFT supports (which would then give me the full abilities of the shell without any hassles, hopefully)...

Wow! Has it been 3 years? I remember reading your original posts 3 years ago when I had beat my head against the same problem for a few months, before concluding that I would have to do what you did. I decided to live with the (no so occasional) overruns.

The poor design of the ST's interrupt structure is appalling from the standpoint of high speed serial communications. From the inside, those midi ports look tacked on rather than built in.

Anyway, good to hear from you again, John.
cheers,
-sam

Hmmm... Weren't the A-Line commands also documented by Atari? I never
used them, but a lot of other people did and were real unhappy when Atari
said "stop using them".

The point is, don't rely on something remaining constant.

bytes, and it was very difficult and lots of places kept it proprietary...
Since you did it, could you tell us (or at least tell us where to look for the info?) A friend of mine was working on some MIDI networking stuff a while ago, but quit it because we both had circa 85-96 ST's with the drop byte bug. (OS does not seem to be the problem.)
Also, some of the very early ST's seem to have a problem with the Joystick occassionally pressing random keys on the keyboard. Is there any fix for this? I tried a newer keyboard, but I don't think the newer keyboards worked at all. My ST is so old...

3940. Smooth graphics in GFA Basic - HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-08 11:16:10 UTC
From: bhwhelan@unix2.tcd.ie
Message-ID: <bhwhelan.689598970@unix2.tcd.ie>
Source record: 46626
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am currently writing a 3D graphical rotation program in GFA Basic and I am having difficulty in creating flicker-free graphics. Does anyone know how to direct graphics commands to a memory location while the screen is displaying something else, and then copy the memory contents to screen and over-write the previous one. Or, is there a way of doing it through the TOS system commands available in GFA? Or am I looking in the wrong place all together?

Any help appreciated - e-mail me if you can.
Thanks in advance.

Unfortunately, I'm not a registered developer.

The unavailability of useful, error-free Atari documentation to the ordinary mortal brings us back to the question of whether Atari are in the market to sell computers or developers' kits.

And Allan Pratt wonders why there is so much badly written software around...

Sounds great!

Are there any information about further bug fixes (SERPTCH etc.)? Allan?
Will the upgrade kit include a 1.44 floppy?

You might try putting the line

SHELL=path_to_your_shell

in your makefiles. If your shell has special hooks for other programs to
ask a already running shell to execute commands for them, you would
half to hack the Gnumake sources and rebuild make.

As a side note, bash 1.10 is available on atari archive now and next
week, the gnu utilities (such as touch) will be made available. If you
want a truely unix-like environment (like long filenames and symbolic
links), I strongly recommend this setup.

>
> Suggestions (besides the repair shop) ?
>
>
>Golando

Maybe you have a socketed second bank of ram.

I have a 520STfm to which I added the second 512k. This was simply a matter of installing the extra 4 ram chips. I soldered sockets in place and then inserted the ram chips.

I then experienced a ram failure of the upper bank of ram just as you describe it. I fixed it by carefully lifting the ST off the desk , up to a height of 4 inches, and then dropping it. (ARE YOU SERIOUS!!!!????) . Yes. Worked fine ever since.

The failure was due to the pins of the chips not making proper contact with the receptors of the socket. I could have opened it up again an re-seated them all, butt....

In fact, I use this technique on my VCR as well. Somewhere inside the VCR there is an audio connection that goes open every six months or so. I am able to record video, but the audio track remains unchanged on the tape. The first time it happened I spent all afternoon tracking down the audio signal but couldn't find a problem. When I gave up and put it together again, it worked! Now when this happens, I lift the VCR about 2 inches (not quite as high because it has more mechanical parts inside..) drop it and VOILA! It works!

This * IS * a rather brutal method, I agree. You take the risk. My estimate is that it will survive easily. Also , I cannot in good conscience take the credit for this technique. It was suggested to me by Mr.QuikST (Ig).
Now that I think about it, I wonder just how many other TV's , stereos, radios etc. are being fixed in this manner AT THIS VERY MOMENT!

WARNING! DO NOT TRY THIS ON YOUR HARD DISK!

I have a couple of questions.

1) How can I determine how much memory I have left when I am running a program? I would prefer to examine some globals, not malloc until malloc fails and then free it back again.

2) What are .cnf files (eg. dandy from terminator and others) and how do you play them?

Thanks

Mike Healy

Fair warning was also given, it must be 2 or 3 years already since the decision to withdraw Line-A was announced. The reason for abandoning the Line-A interface is clear --- it is extremely limited in terms of pixel and colour resolution, why restrict any (graphical) program to 3 or 4 "silly" resolution modes.

>The point is, don't rely on something remaining constant.

More to the point --- Documented features are usually phased out gradually, instead of disappearing overnight.

>WriteTrack == FormatTrack, the control-codes tells the controler where to
>put CRC and SYNC. It is not a bug.

My point is that the FDC has no business writing CRCs and SYNCs in the middle
of data sectors. Those (usually empty) sectors could have been protected and
given full binary capability under the write-track command, by adding a little
extra logic to the 10-bit counter that keeps track of sector length in some
of the other commands.

If I am wrong about the CRCs being calculated on the fly then I'm sure someone
will correct me. I have very little doubt that the chip was in fact implemented
in the way both Streng and Klaus mentioned, without any protection against
using "special bytes" within sector data zones. If this arrangement has some
practical use then I will call it a feature, otherwise a bug. Most likely it
was a deliberate design decision forced by time, money and irate management.

Hi,

From memory (a seldom used protein-based device) pins 1 and 5 are used for MIDI
THRU on the ST. The MIDI standard defines pins 2,3,4 as the pins to be used for
"normal" MIDI transmission.

What is the CRAFT Shell?

I haven't seen it here in the United States.

Also, I am under the impression that Lattice C Ver 5.06 doesn't
have a complete UNIX style 'cc' command so you can't use GNU Make
(or any other make) with it.

I own LC5, but my last update was last January to version 5.06.02.

what is your latest version over there?

Also, I just got a copy of the German Turbo C compiler.
seems good but I can't read the german docs , my luck!!

3953. 1040STFM & PC monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-09 19:38:18 UTC
From: rvuori@klaava.Helsinki.FI
Message-ID: <1991Nov9.193818.10618@klaava.Helsinki.FI>
Source record: 46491

I just borrowed my brothers Atari ST (and all of his other MIDI equipment) and really love it's MIDI features. BUT, the 1040STFM is connected to an old Philips composite video monitor and the quality of the picture is really horrible, especially if you are used to Sony SuperVGA Trinitron tubes...

Now I happen to have some spare PC monitors, which all have pretty decent quality and was hoping to connect them to the ST, but havent found out really how to do it. As far as I know the pins are as follows:

Pin: 1040 STFM MDA/Hercules CGA/RGB EGA/RGB

1. Audio out Ground Ground Ground
2. Video out Ground Ground red
3. ??? N/A Red Red (primary)
4. BW out? N/A Green Green (primary)
5. Audio in N/A Blue Blue (primary)
6. Green out Intensity Intensity green
7. Red out Video in N/A blue
8. +12V H-sync. H-sync. H-sync.
9. H-sync. V-sync. V-sync. V-sync.
10. Blue out
11. BW signal?
12. V-sync.
13. Ground.

I haven't really figured out the what pins 11, 4 and 3 are on the ST, and how I should connect it to any of these monitors. I would especially like to connect it to an MDA/Hercules monitor as it anyway won't show more the two colors at the highest resolution which is the only one I'm really interested in (even though it would be nice to play some games on a good colour monitor:-)

Thank you in advance!

>Well, they fixed the RTS/CTS interrupt handlers, but forgot to set up the
>MFP active edge register.

>Really, if you have to use CTS/RTS, you _need_ TURBOCTS.PRG

and if you're unlucky, even that doesn't help.

all TOS versions i know (and all those `fix' programs i know as well,
including ataris `new and improved' tos14fx2.prg) still rely on their
interrupt hooked up to the CTS line to keep a flag of the current
state of that line, instead of looking at the line themselves when
they decide whether to keep continue sending.

result: because of murphys law, and the (real low) priority of said
interrupt, your modem/whatever may still get 2-n more bytes after
taking away CTS -- and what then happens entirely depends on the
firmware of the modem: some don't mind, but some really hate that,
and nothing works...

(and then there are some possible race conditions because of missing
or #$700,sr 's, spurious `start bits' sent in Rsconf(), etc etc...)

and TOS is getting 7 years old and things like that still aren't fixed. :-(

sigh,
Juergen

You can pass Malloc a -1 value, and the value it returns to you will be
the ammount of free memory left that you can allocate. Normally that
value would be the address of the memory that has been allocated, but it
is changed in this special case.

I hope this helps you out.

Funny thing is that ALL of the Western Digital chips
work that way, so are they all wrong, this is the way they are made.....

Source record: 46501

I agree whole-heartedly with these sentiments...

I have just inquired into how to become a registered developer... but I have been put off by the 300 pound price-tag and the draconian non-disclosure agreement.. Officially, if you sign the agreement, ALL details about Atari computers are a commercial secret!

This means that even 5 year old GEM documents are restricted!

Please Atari, make the normal development documents available to normal users like even IBM does! (I wouldn't say IBM were a free and easy organisation)

Without these documents generally available how does Atari expect to have software written for machines?

Why doesn't Atari do as Commodore do, publish the documents in a series of manuals via a well known publisher? They would get all the royalties.

Steve

Note that this returns the size of the largest block, so if your
memory is fragmented, it will return less than what you'd expect.

don't know about floating around, but i hacked the `original' elvis
1.4 quite a bit (ie not that strange turbo c version that doesn't
even work with german keyboards...) so that it knows MiNT, uses the
`real' -ltermcap and also has a few bug less. (well i hope.) if all
goes well the changes will be incorporated into the next official
version, but if you like i can also mail you my 1.4 diffs for
`beta test'. ;-)

> On a somewhat-related note,
>is there a version of less that's MiNT compatible?

well i guess that one is also answered by now. :-)

> anybody have any experience with such a setup?

I've had similar problems using XON/XOFF flow control with 9600MNP modems and
running them at 19200 on the serial port. It wasn't until I borrowed a
datascope from work that I found my problem: the modem was continuing to
"dump" its buffer(s) after receiving the XOFF, to the tune of OVER 300(!!)
characters. This was too much for the ST which was only set up to handle
64 chars MAX. Changing the low-/high-water marks for the RS232 port was
my solution.

[The standard buffer is 64+128+64=256 characters. Making it 512+1024+512
(2KBytes) should handle most cases for the foreseeable future...]

If this is also the problem with HW flow-control, you could try specifying
larger buffers with more space for the low-/high-water marks...
One way is with AUXINIT.PRG in STalker3's EXTRAS folder, or rolling your
own...
- get the buffer record with Iorec(0) which points to
long ibuf pointer to an input buffer
int ibufsize size of the input buffer
int ibufhd head index
int ibuftl tail index
int ibuflow low water mark
int ibufhi high water mark
If you need it, the output buffer pointers are immediately following the
input buffer stuff (same format).

Hope this helps...

3962. Using Gemdos from Gemdos

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-11 07:20:35 UTC
From: rfschaa@cs.vu.nl
Message-ID: <11551@star.cs.vu.nl>
Source record: 46496

Hi,

Does anyone know whether it is possible to use Gemdos calls from
code that replaces part of Gemdos (i.e if I write code to replace
some call, say `Fsfirst', is there a way to use calls like `Fopen'
from that code)?

Please note that I am looking for a way to do it in a documented way,
not some kind of hack that works on TOSx.y and not on other versions.

Please let me know,

Richard Schaaf (rfschaa@cs.vu.nl)

3963. Re: Increasing memory on 1040ST?

> SIMMs on a lot of machines today -- replacing 1Mbyte chips with, say, 4Mbyte
> ones.

Its possible but uncomfortable. I increased the memory of my 1040ST from 1 to 2 MBytes
4 years ago (256 Kbit Chips were cheap at this time and 1Mits very expensive).
As the upgrade of the early 520 to 520+ I soldered chips onto the existing banks.
In the 1040 there are 2 banks with 16 256k chips. So I soldered 32 (!) 256 Kbit-chips
onto the 32 existing chips and build a MMU extension (3 custom HCT-Chips) to simulate
1 Mbit-Bank with 4 256 Kbit-Banks. You need only connect 1 Pin of the banks above and
replace some Resistors with cables to the MMU-board.

Another way is to throw away the 256K chips but it is hard to replace them with
1 Mbit-Chips. You better make an own board and connect it to the right places.
The original Rams can be left in the main board when you disconnect the power and
other signals.
It should be possible to use 4 1Mbyte SIMMs or SIPPs instead of an own board to get
4 Megabyte.

> Can I do something similar with this? Would I then have to change
> the TOS ROMs, or are the internals well enough behaved that they don't
> expect 1Mbyte to be the hard ceiling on the memory here?

You have nothing to change in the ROM and the other internals because the
64Kbit, 256Kbit and 1MBit chips are supported. I know nothing about support
of 4Mbit chips (I use only TOS 1.04).

If some people are interested in the MMU-extension I can post some more details.

Sincerely,

U. Graef

>GNU Tar v1.10.

You should consider to rewrite it or at least modify it. I have looked over
Paul's code during the weekend and found a number of things that should be
changed. No offense to Paul is intended, I'm happy to have his code to look
at and learn from it.

Unfortunately, the tar and driver work ONLY for Archive streamers in QIC24
mode. I couldn't get it to work with my Wangtek 5150 ES at all. At first
I thought it would be enough to modify the resident driver, but there are
device-dependent parts in the C code of the tar utility as well.

I have not tried to compile the tar source for lack of time (and also since
I don't have Mark Williams C -- I guess some changes for Turbo C are needed)
so I can't tell you if it will work at all but I'm confident I'll get some-
thing to work after all :-).

Another thing bothers me: the driver is currently hooked into the BIOS trap,
thus creating extra overhead for every BIOS call the system or a user program
makes. I believe this is A Bad Thing. (Hello Allan P :-)

Nowadays there are more ways to make a driver resident than a BIOS extension.
I'm currently trying to decide between (a) using another trap (say, #6) for
the interface, and (b) not using any trap but a function jump table pointed
to by a cookie.

Method (a) would allow us to use the same mechanism as BIOS and GEMDOS calls,
but would require some housekeeping to check if the trap was in use etc.
Method (b) makes the tape function look like part of the user program, thus
one could pass parameters in registers etc. So I'm leaning towards (b) right
now.

What do people think? I like the idea of a modular driver that several tools
(like tar, mt, cpio, dd etc) could use without having to cram all the SCSI I/O
stuff into each binary. If we do it right lots of wheel-reinventing might
be avoided.

Let's agree on a standard and I'll implement it for Wangtek streamers.
I've set Followup to comp.sys.atari.st.tech since I believe it's a technical
topic.

3965. GNU UTILITIES POSTED TO ATARI.ARCHIVE

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-11 16:34:01 UTC
From: jgj@ssd.csd.harris.com
Message-ID: <JGJ.91Nov11113401@rcx1.ssd.csd.harris.com>
Source record: 46502
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just posted the binaries to the GNU Utilities to atari.archive.
They should show up there before long. Man pages and sources will be
sent later this week or next week. The following is the readme file
that accompanies them:

##

This is my port of various gnu utilities. They are intended for use
under bash1.10, also available on atari.archive.umich.edu. Together,
these give you a rather complete Un*x environment based on gnu software.
The following zoo archives are available. These also include some
non-GNU public domain software.

```
executables source manual_pages
-----------------------------------
file31b file31s file31m
shell13b shell13s shell13m
text11b text11s text11m
misc1b misc1s misc1m
README
```

What do you need to set yourself up? First, you need bash. I
keep everything on disk D: under a directory called gnu. The
following is my directory setup:

```
gnu
bin
gxxinc
include
lib
man
etc
```

Until you have a good feel for how everything works together, I
recommend you use it. Put bash.ttp in \gnu\bin. Now you need to know
about UNIXMODE. The gnu libraries emulate unix style filenames and
symbolic links. If a filename consists of all digits and lowercase
letters and has no more than 8 characters plus 3 character extender,
it maps directly to a TOS filename. Otherwise, a name TOS file is
made up from the real name and an entry in a file called ".dir" is
maintained to describe the mapping. Symbolic links are also recorded
in the same filey. This feature is controlled via the UNIXMODE
environment variable. It is a string of characters for customizing
UNIXMODE operation. By default, bash will set it to "/.,rCLAHdb".
These characters mean:

"/" permit "/" as well as "\" to separate path elements
"." map extra periods to "," when deriving TOS names.
"rC" make root file system be drive C.
"L" permit symbolic links
"A" permit unix style filenames
"H" hide the .dir file from directory searches
"d" provide psuedo device directory
/dev/X is file system x:
/dev/console is CON:
/dev/tty1 is AUX:
/dev/lp is PRN:
"b" open files in binary mode

The only ones you would every probably want to modify are "rC" to
select another file system as root and "d" if you use MiNT. MiNT
users will probably want to use the string "/.,rULAHb". Note that
this must be setup before you run bash. I've included in the readme
archive a program for setting desktop's environment variables that
a stole from a TeX distribution. Note that programs compiled with
the MiNT libraries do not know about UNIXMODE. hence you must
use command lines like
$ bg -o d:\\nohup\\output command string
when using MiNT utilities.

You will want to put all the binary archives (*b.zoo) in /gnu/bin
and than manual pages ones (*m.zoo) in /gnu/man. Now, what all
do you get? The following lists the commands from each utility
package with notes on some of them. Some individual tools are not
ported since their functionality is not available under TOS or
UNIXMODE.

***** README ******
copying -- the GNU communist manifesto
copying.lib -- the GNU communist manifesto for libraries
env.inf -- see setenv.prg
passwd -- sample /etc/passwd (Yes it is usefull. Files pretend to be
owned by user 1. Make an entry for yourself to make ls -l
and some other commands look nice.
profile -- sample /etc/profile. When you start up bash, give it the -login
parameter.
readme -- this file
setenv.prg -- program for setting environment variables from desktop.
I've never used it. I don't have source. Don't tell
me about problems with it. Uses env.inf.
termcap --/etc/termcap used by emacs and some other programs.

Out of curiosity, I tried this too - I made a 30K file of zeros, and played it through DMA with that stellar program ;-} STESOUND.PRG. I got deafening silence - zilch, nada. Maybe you have some hardware problem with the DMA sound. 2.2 seconds is definitely not a file header or something - that's a LONG time in a sample, an IFF header would just sound like a blip.

This sounds like the CPX doc that registered developers get from Atari.
Although I would like to see this freely available for all ST hackers, I must
ask you not to post this anywhere. This would only reduce the amount of info
that Atari does make available to us developers.

> I can't find the current DTA address; is there any way that I can
> do this while processing a TRAP #1?

The current process' DTA address is recorded in the basepage which can
be derived from the act_pd system variable (this in turn is recorded
in the sys_base (the first few bytes after the ROM-start) for TOS
versions >= 1.2).

BTW.:
You should be able to call trap #1 recursively if you do it inline
(for example in assembler) and avoid library routines that save the
return address in a static memory location. The shell that i am using
(Master) calls trap #1 very often in this way (even from inside a
bios-trap --- but that's another story).

Hope this helps!

>I can't find the current DTA address; is there any way that I can
>do this while processing a TRAP #1?
Experience tells me that you can call a GEMDOS function in your own
trap #1 handler _before_ executing the actual function desired by the
user or OS. So build a trap handler, analyse what you get on the
stack (beware of the difference between 68000 and 68010/20/30/40),
then call Fgetdta (save those registers!), then call the desired
function. Worked for me, but I don't know if this is a documented
feature, so please don't blame me if it won't work. It just seems
logical if you look at the way the GEMDOS trap handler works.

Do you _really_ need to know things like that? Another method comes
to my mind: If you're linked into the GEMDOS trap you can also
follow any manipulation of the current DTA address by tracing
Fsetdta calls (watch out for those Pexec calls that place the
default DTA into the basepage). Sounds much cleaner to me, but then,
--MORE--(81%)
this method assumes that DTA addresses are only changed by Fsetdta
and Pexec calls and that GEMDOS doesn't change them internally.

Good luck,

>I can't find the current DTA address; is there any way that I can
>do this while processing a TRAP #1?

Since you're intercepting trap 1 calls, this should be cake. Trap 1 is
not inherently non-reentrant, it's GEMDOS that makes it so. Your code
could make a "real" trap 1 call into GEMDOS for the Fgetdta call.

Making a "real" trap 1 call can be done two ways: either you replace
the old trap 1 vector, make your call, then write yours in again,
or your "fake" the trap 1 by creating a stack frame and jumping to
the old vector.

Any time you catch GEMDOS or BIOS traps, or create a trap or interrupt
stack frame, you should be sure to check the system variable "longframe"
at $59e (word). If it's nonzero, you are on a machine with "long
frames" -- an extra word on the stack after the SR and PC. Only the
68000 has short frames; every other 680x0 has long frames.

I am answering this in such detail because I want to forestall somebody
else pointing out that you can look in the current process' basepage for
its current DTA pointer. This is not a published fact, and therefore the
location and meaning of that variable is subject to change.

How do I access the second serial port of the MEGA STe?
I vaguely remember a new OS call to select one of the ports as
the serial port as used for AUX:, but I don't know the details.

Thank you in advance for any information.

I could have sworn I saw an upgrade that uses SIMMS in a standard ST.
I will try to look through some magazines and stuff and come up with some
sort of list of upgrades thare are currently being advertised/offered
by various companies. It's not much but at least it may give you an idea
of what's out there.

Message-ID: <1991Nov11.195948.26722@ryn.mro4.dec.com>
Source record: 46510

Hi,

I'm curious as to the statement about "the OS is not the problem"...

I have a REAL OLD ST, and assumed that the OS was the problem. I originally tried to use the sub vectors, 1 for mouse, 1 for keyboard, 1 for MIDI, etc., but I still lost bytes...

I found that the vector at (hex) 118 is what is jumped to whenever a level 6 interrupt is encountered. My code therefore has to handle keyboard, mouse, joystick, and MIDI. I have found that I will NOT lose bytes if the code is written properly.

I did however have to rewrite the mouse, keyboard, MIDI and joystick handlers. I sure learned a lot, and and I'd be willing to post a .PRG that is a demo of my "windowing" system, if anyone wants to see it. As I've spent 3 years working on this stuff, I'm really hesitant to post source though!!

Message-ID: <14731@castle.ed.ac.uk>
Source record: 46505

All this is all very well except
a) nobody has answered the original question of how to write a
CPX in a legal fashion.
b) everybody on this newsgroup must know already that our lives
would be much easier if Atari would give developer's docs to humble
mortals and must also know that the chance of this being done is
just about nil.

As for new CPX's already written I saw some on lancs.pdsoft but they
did not look very good. As I see it the role of a CPX in the system is
to control some other TSR utility or such thingnot to act as an
alternative DA.

It ought to be, although I am not certain I think that if a piece of
code catches a TOS trap handler before TOS gets to know about it then if
you change back yo user mode you can call anything, even the AES, MiNT
certainly catches Gemdos, BIOS and XBIOS calls.

> from that code)?

Well, if you've caught the trap #1 vector then your code is not "in"
Gemdos when it's executing, so it's certainly possible to make Gemdos
calls from it by building the appropriate kind of exception frame
(depending on the processor type) including a return address to your
own code, and then jumping to the previous trap #1 vector.

However, replacing parts of Gemdos is not something to do lightly.
There are all sorts of complications (for example, in order for Fsfirst
to work properly it needs to know the current working directory and
the current drive), and there are also potential problems with
compatibility with future versions of TOS.

Is it really necessary for your code to replace trap #1?

Exactly what I was saying, and probably true for other types of controller also (765 ?), but why so? It is still a bug, whether deliberate or accidental. Give me one good use for it and I'll call it a feature.

3984. Re: The Cartridge Port - How to use.

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-12 08:06:53 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <15675@uhccux.uhcc.Hawaii.Edu>
Source record: 46523

This info comes from looking in the Abacus ST Internals book and I hope
other people can add corrections!

The memory area for the cartridge port starts at $00FA0000 and spans
thru 128 KB (ends at $00FBFFFF).

A ROM would have to configured in this way:

Memory Data
------ --
FA0000 ABCDEF42 (designates a user ROM cartridge)

[The next two longwords are a pair of pointers and you can have as many
pairs as you like. The last set should have the first pointer set to
a long zero (four zero bytes)]

FA0004 (either a long zero or a pointer to next pair of pointers)

FA0006 (pointer to user init routine. the address should begin
on a 2, 4, or 8 (ex. FAF002, FAB004, FAFF06, etc.) because
the D0 register tests a bit against the pointer in the
TOS ROM routine.

3985. advice on using the STe Parallel Port as a control port?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-12 13:36:54 UTC
From: gerry@seq1.keele.ac.uk
Message-ID: <1800@keele.keele.ac.uk>
Source record: 46524
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I am posting this for a friend so this is all the info I have:-

Does anyone have experience/advice about the software side of using the
STe Parallel Port as a bit by bit input/output control port
for lego-like motors and sensors? Is it just a matter of putting a
signal on and doing a read, then masking to get the input bits?
Plus any advice on the hardware side so that I don't destroy the MFP.
Have any PD programs been posted that do this sort of thing?

any replies, by email to me, gratefully received.

3987. MiNT 0.91

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-12 15:16:04 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1991Nov12.101605.219@uwovax.uwo.ca>
Source record: 46526
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MiNT 0.91 is now available at atari.archive.umich.edu, and has been sent
to comp.{binaries,sources}.atari.st (I had asked the moderator to hold
onto MiNT 0.9 until the newer version was available).

ksh works under this version of MiNT (if anyone knows Guy Gascoigne, please
tell him to change the string "x:/*.%03d" to "x:*.%03d" in the next
version of ksh; MiNT now longer officially supports '/' in place of '\\',
although I did put a hack into Fsfirst so that ksh will continue to work).

Also, programs linked with dLibs (including the sozobon C compiler) will
work under this version of MiNT, so the problems people have noted with
less and elvis *should* go away (let's keep our fingers crossed :-).

Finally, there were a couple of bug fixes, and some streamlining of the
memory allocation functions that should reduce memory fragmentation a bit.
If you've been having compatibility problems with MiNT 0.9, by all means
get the newer version!

3990. Help on dint() function call

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-12 17:32:58 UTC
From: jharres@sleepy.bmd.trw.com
Message-ID: <2210.291faddb@sleepy.bmd.trw.com>
Source record: 46527

In the following code the call "dint" does not work correctly. The value of min1 is -2.00 after the calculation, when it should be on the order of 725,770. The code is pulled from a larger program with the necessary data setup for testing simplicity, so don't flame me on style.
Can anyone see something I've done wrong?

This is done with version 2.1 of LaserC from Megamax. I suspect the compiler but am not 100 % confident of that. I haven't gone back to 2.0 where I believe dint worked before. Megamax is out of town for the week so no info there (yet).

```
/*************************************************************/
/* JULDAY.C 11/11/91 */
double start;
int start_year, start_month, start_day;

/*************************************************************/
double
julday(y, m, d)
int y, m, d; /* year, month, day */
{
static int difm[] = {0, 0, 31, 59, 90, 120, 151,
181, 212, 243, 273, 304, 334};
double min,min1;

if (y%4 == 0 && y%100 || y%400 == 0) /* leap year */
if (m > 2) /* after Feb */
++d; /* Feb had an extra day */

if (y >= 0)
--y;

min1 = dint(y*365.25) - dint(y*0.01); /* here's the problem line*/

min = min1 + dint(y*0.0025) + difm[m] + d + 1721424.5; /* this dint also */

return min;
}

main()
{
start_year = 0;
start_month = 9;
start_day = 15;
start = julday(start_year+1988,start_month,start_day);
printf("start = %6.4f\n",start);
}
```

thanks for any help

I have the JRI SIMM board in my 1986 1040STF. Been in there a year or so I think. Email me if you want addresses. It takes some soldering (fortunately a friend of mine was born with a soldering iron instead of a silver spoon).

From the Holy Book of <1991Nov12.023124.7455@actrix.gen.nz>
as spake by Roger.Sheppard@actrix.gen.nz (Roger Sheppard) :
>You are a bit out of Date with this..Atari does have a 2 tier
>Developer support now, has been on for some years..
>
>One at $300 and the othere for $125, the $125 is for Hobby programers,
>and you can't get cheap hard ware deals from Atari with that option..

That's $125 + $50/yr renewal fee, isn't it? That's still an awful lot for the
hobbyist who doesn't plan on making money from his programs.

Atari UK are going to start selling the FULL docs as a hobbyist scheme soon.
You only get the docs and not the software like the developers pack has but
it should be a lot cheaper (75 pounds?).

Source record: 46528

```
Here is a little something that has puzzled me for years, but now
that I am actually being bitten by this strange behavior in an actual
program, I figure I might get some help from the mighty c.s.a.s.t
community.
--- Cut ---
start:
clr.l -(a7) ; First load TEMPLEMON
move.w #$20,-(a7) ; (void) Super(0L);
trap #1

loop:
bset #6,$FFFFFA15 ; enable (mask) keyboard IRQ
bclr #6,$FFFFFA15 ; disable (unmask) keyboard IRQ
bra.s loop ; now move the mouse (what the f...??)
---- Cut ---

Hint: The MFP vector registers high nybble gives $40, which happens
to coincide with the exception we get. SYS_MON sez spurious interrupt
Level 0 (might be NMI, don't know fer sure). Looks like an auto-vector
thing is happening, but why ?

Nat!

PS.: In my program I set $40 to an RTE and everything works well.
PPS.: Yeah, I could have done LEA $FFFFFA15,(A0) MOVEQ #6,D0 BCLR D0,(A0)

3997. Re: sozobon c problems

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-12 23:28:36 UTC
From: jmb8302@tamuts.tamu.edu
Message-ID: <5882@tamsun.tamu.edu>
Source record: 46530

What is the correct method for loading and using external fonts?

I've created two fonts. For the first font I used the font_editor

that comes with Degas Elite. For the other font I used the FED font

maker(You can save it as .FED,.O, or .C)

The problem I have is that no matter what I do, my fonts are never

used by the system! Here's what I've tried:

I. I've used vst_load_fonts(handle,select) and vst_font(hadle,font)

with GDOS loaded. The fonts load up fine, but when I use

vst_font(handle,font) the system bombs.

II. I've tried to load my font into an area in memory, then place its

address into the TOS font loacation address ($8820)

The problem is that in all the books I have read, EVERY one of

them gives a different address where the system font resides.

For example some say it is:

$8820

$FFF2

$388

C

$1C8

$016

$054

Well, I think you get the picture. What I want to do is

have the system variable that points to the address of the

system font point to my font instead.

(ex: my_font holds address of my font

say that $fff2 holds address of system font

```
also a0 = 0

move.l my_font,$fff2(a0)

)
```

Actually what is the memory location that holds the address of the

system font???

Thanks,

Jeff Bilger

>--
>*** Roger W. Sheppard * Roger.Sheppard@bbs.actrix.gen.nz ***

This is just another example of why the Atari market is
so dead here in the USA. Atari Corp has never allowed much
offical documentation to be published. And when some magazines,
most noticable some UK mags, tried to publish details of TOS,
Atari Corp threatened them with everything.

So, as a result you have no reliable source of programming hints
for developing software on the ST.

compare the Atari situation to that of the Apple Macintosh. Apple
has encouraged the release of programming tech notes, to the
extent that you release them on the networks. So, the result
is that you can buy a dozen books on programming the Mac, most

noticably the "Inside Macintosh" series.

So, is it any wonder that little or no new software is being written
by the small home hacker?

Also compare the ST/TT to the UNIX and X Windows market. There are
hundreds of books out for writing old fashioned character oriented
UNIX programs. And now there are tens, or maybe hundreds, of books
showing how to program X Windows, MOTIF, and OPEN LOOK programs.
All of these book enable individual programmers to write programs,
which means there will be more programs out.

It is no wonder that there isn't a single ST/TT programming book
still in publication. All of the COMPUTE! books are out of print.

As long as Atari Corp treats TOS programming as some great trade secret
you won't find any definitive books on TOS/AES/VDI books. At least
none that will agree with Atari.

So, if you want a machine that allows you to hack, then buy a
UNIX X windows machine, or a Mac, or an IBM PC clone. At least
with these machines you can get docs on programming!!

Geez, what is the big deal about releasing a doc file showing
how to write CPX programs?

Doesn't Atari want CPX programs written??

why does Atari Corp go out of their way to stifle programming
for the ST/TT??

Why can't Atari just release said notes to the entire community
and not to some favored few??

Is Atari hurting for cash so much that it has toblackmail
individuals?? Pay me $$ or you will never see docs on programming
the ST/TT!! Geez, just release the docs!!

4003. desktop.inf and fileviewing

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-13 08:40:15 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1991Nov13.084015.19026@daimi.aau.dk>
Source record: 46533

[This may be common knowledge, but the following trick was new to me.]

The following trick will enable you to view any file with a program of your own choice, just by double-clicking on the file.

Install the program as normal with some (actually any) extension. Save your desktop and load desktop.inf into your favorite editor. Now find the line that correspond to the installation of the fileviewer, and move that line up BEFORE the lines that determines what files are executables. Furthermore edit the extension to *.*@

After doeing this, my desktop.inf looks like this:

```
#a000000
#b000000
#c77700070006000700552005055522207705570750555077031111103
#d
#E 78 13
#W 00 00 00 03 4C 0C 08 C:\APPL\*.*@
#W 00 00 02 0B 4C 09 00 @
#W 00 00 0A 0F 34 09 00 @
#W 00 00 0E 01 34 09 00 @
#M 02 00 00 FF D HARDDISK@ @
#M 01 00 00 FF C HARDDISK@ @
#M 00 00 00 FF A FLOPPY DISK@ @
#T 00 07 02 FF TRASH@ @
#F FF 04 @ *.*@
#D FF 01 @ *.*@
#P 03 04 C:\BIN\MANPAGER.TTP@ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#P 03 FF *.TTP@ @
#F 03 04 *.TOS@ @
#G 03 04 C:\APPL\UTIL\DIVERSE\CMD\CMD.PRG@ *.CMD@
#G 03 04 C:\TEX\SHOWDVI\SHOWDVI.PRG@ *.DVI@
#G 03 04 C:\APPL\UTIL\DIVERSE\TOM_SHEL\TOMSHELL.PRG@ *.TOM@
```

As you can see, the viewer (in my case c:\bin\manpager.ttp) is now placed before the *.APP and *.PRG stuff.

The trick is that the document type for c:\bin\manpager.ttp is *.* which matches anything. Therefore it must be the last pattern tried by the desktop. The desktop searches the list in reverse order, therefore the entry must be first. Otherwise any other program would be seen as a document for the manpager, including any executable file!

I tried it yesterday and it really worked. I have TOS 1.4, but I suspect that it should work under older versions as well.

>What is the CRAFT Shell?

It is a shell which has a lot of features similar to those found in Unix
systems. It is more or less CSH/KSH style. It has got history and aliasing.

The best thing with this shell is that it enables the use of '/' instead
of '\' in pathnames and I've been using it for almost 2 years now.

It has very few bugs although I have heard that it doesn't like STE systems.

It also comes with an editor which is quite good if you take the time to
learn how to use it efficiently.

>Also, I am under the impression that Lattice C Ver 5.06 doesn't
>have a complete UNIX style 'cc' command so you can't use GNU Make
>(or any other make) with it.

That's partly true. It doesn't for some obscure reason not come with a
"standard" cc interface and it's a pain not to have one. Lately, however,
I have got around this and started using GnuMake so apparently it is
possible to use it with a make ...

>I own LC5, but my last update was last January to version 5.06.02.
>what is your latest version over there?

I'm not sure but it sounds like the version I have. I'll look it up and
mail you ...

>from that code)?

You've got to fake a TRAP #2 call. Your GEMDOS intercept routine should know the address of the previous handler -- what you have to do is put the right things on the stack and jump to that address. Don't forget to check _longframe at $59E, as this will tell you whether you need an extra word on the stack for processors > 68000.

>Please note that I am looking for a way to do it in a documented way,
>not some kind of hack that works on TOSx.y and not on other versions.

This should work on all TOS versions (unless, of course, I'm mistaken)

I am not familiar with either of these packages, but it doesn't sound as if
they create fonts in GEM .FNT file format. You need a Font editor that does
(I highly recommend Fontkit Plus 3 from the ST Club, BTW)

>The problem I have is that no matter what I do, my fonts are never

How do you know your fonts are loaded? It sounds as if they're _not_ loaded
(this will be true if your fonts are not in GEM format, and if you haven't
set up ASSIGN.SYS correctly)

> II. I've tried to load my font into an area in memory, then place its

> system font point to my font instead.

They're all wrong -- this location is not fixed. It used to be possible to
find the address of the system font using the A-Line variables, but these
are now unsupported by Atari. If you want to find the TOS fonts, I suspect
that you'll have to do somthing dirty (like scanning low memory for something
that looks like a TOS font name!)

To use your fonts with GDOS you will have to:

1) Use a font editor that produces GEM .FNT files
2) Add your fonts to ASSIGN.SYS
3) Reboot
4) Use vst_load_fonts, vst_font and v_gtext as documented

While it is undocumented, the
#F FF 04 @ *.*@
Line controls the default print file option (or at least that's what's been
reported on the net some years ago). My Desktop.inf contanins
#F FF 04 C:\ETC\TYPE.PRG *.*@
and that seems to work very well.

lancs.pdsoft, or as it should be written, uk.ac.lancs.pdsoft (or pdsoft.lancs.ac.uk in world order) is a public-domain archive for use by the UK academic community.

Unfortunately for the rest of the world, JANET (The UK academic network) is only just starting to use IP protocols. Most (ie 99%) of the JANET sites us the 1980 Coloured Book protocols over X25. This means that the archive is not available via FTP.

There is a light at the end of the tunnel though, as the machine at Lancaster University does have e-mail and a mail server system, but don't ask me how to use it!

Steve

I know this has been asked before, but I can't remember the answer...
so...
What's wrong and how do I fix this, when my good ol' atari B/W monitor
sm 124 has gone a little leftist ie. The picture is sliding closer to
the left edge of the screen... a litle bit closer every day ???

-will it eventually go out of the screen... ? no virus possible !

Date: 1991-11-13 15:29:23 UTC
From: bkr@drdhh.hanse.de
Message-ID: <1991Nov13.162923.13252@drdhh.hanse.de>
Source record: 46480

rfschaa@cs.vu.nl (Schaaf R F) writes:
>Does anyone know whether it is possible to use Gemdos calls from
>code that replaces part of Gemdos (i.e if I write code to replace
>some call, say `Fsfirst', is there a way to use calls like `Fopen'
>from that code)?

[.hope.that.no.one.'ll.bust.me.for.that]

The way I do such things is:

On trap entry:
Preserve all your stack environment/regs:
(sr, pc, look for >68000 processors stuff).

Now, move your arguments to the stack and
then push all the stuff that is normally
pushed by a trap (sr,pc, see above).
Instead of the pc you should push an address
in your code to return to.
Now move.l old_gemdos_trap,-(a7)
rts
To jump into gemdos. Upon return don't forget
to adjust the stack ONLY for the parameters.

<<< THINK OF THE TT STACK STUFF !!! >>>

I think this isn't documented, but I can't
find anything illegal at it. It doesn't
use undocumented locations, it doesn't
rely on reentrancy and it doesn't change
any regs / status affairs.

If anybody thinks that I'm wrong, so please
tell me and the net community.

Greetings, Bjoern

Hello World,
Are there any ill effects from forcing a ST to run at 50Hz?
It seems that running a machine ar 50Hz, causes the graphics to be
clear especially in medium res., but the screen area is smaller.
Is there anyway to run the machine at 50Hz and at the same time
increase the size of the screen area to normal size.

I personally believe that if Atari did release inside technical notes
for thier machines, that there WOULDN'T be any software AT ALL....

Simply because people would look at TOS/GEM on the TT and wonder why and the
hell should they waste thier time?!

This way you have to sepnd a long time trying to figure out what is what,
and by the time you do, its too late, you have already written the program!

SO you mine as well sell it!

My second guess would be everyone would be embarrassed :). Every morning
Atari employees would have to show up for work with paper bags over thier
heads!

Not that I don't where one myself. :).

But as far as professionalism goes, I am very immpressed with the Apple
developers and Commodore documentation materials I find at your local
B-Dalton Software cellar.

They are very well done, and when a company
goes out of their way to publish in house materials to educate the
masses on how to get the most from their spending dollar, I think it
says a lot about the people who own the company and that they are committed
TO STAY.

So if you look at Atari in that light, its VERY expensive to own an ATARI.

From: harryk@bucsf.bu.edu
Message-ID: <93846@bu.edu>
Source record: 46449
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, it's me again with one more question:

I've written some code that shows the free space of a selected drive letter (including hd partitions)...using Drvmap() to find which drives are active and Dfree() to calc the free-space on the user selected drive.
The problem is that if the user selects drive B: he's asked to insert disk B: in drive A: (I don't have an external drive), and as soon as he does so the ST freezes, or bombs, or resets (totally unpredictable)...It is worth mentioning that this is an accessory program and that I have a MegaST 2 with TOS 1.2 (or 1.02).

Has this to do with the fact that both A: and B: drives are mounted on one physical drive? Is it a bug of Dfree() or what? I 've checked my code very carefully & don't find anything wrong...this is additionally confirmed by the fact that it's running fine with ALL other drives.

thanks in advance....

Source record: 46453

Greetings,

I am working on a project which will turn my ST into an
programmable IR remote control. (I got the plans from
an anonymous ftp site, which I don't know off the top
of my head, but could find if someone is interested.)

In order to be programmable, I need to sample other remotes'
output at a relatively high frequency. I want to read data
from the cartridge port at, say, 100kHz for about .5 seconds.

I am a recreational programmer (Pascal, C, some assembly), and I
want to know how to read from the cartridge port at a specific
frequency. Any hints, suggestions, warnings, questions will
be appreciated.

Please respond via e-mail or post to the net.

Thanks,

Actually, I think it would be better if he used "u:\\proc*.%03d" because
the X: nomenclature is (hopefully) going to go away one day. It's still
there for compatibility, but I hope it will not be there forever; it
pollutes the drive-letter-space to have X:, V:, Q: and U: tied up when
running MiNT. Using only U: is much better, I think, and is to be
encouraged for MiNT programming in general.

I think there is a BIG reason that Atari does not release the Info
on the Atari OS's, they do have things to hide, but posibly for a
different reason .

Well if you are not that good at any thing you don't go telling the
World that your OS is a Big Can of Worms, do you..!

Could it be that Atari thinks that it will be Laugh at by the rest of
the World ?..

May be this is food for though...

| ... Many programs unfortunetely assume there are 25 lines on the
| screen (less.ttp is unfortunetely one of these), so they only use the top
| half.

Is there a std. way that programs can interogate the # of rows on the screen? Or force it to 25 lines and reset it later upon exit? It is true that there are way too many programs that run in monochrome and *insist* on 24 rows! Or better yet, there are GEM programs that end up mixing the 2 fonts for 24 and 50 row screens, which makes for a *real* beautiful layout! One that comes to mind is the German formatter MEGAFORM.

Of course under gulam on can always set up an alias such as:

alias less "set nrows 24; less $1; set nrows 50"

Cheers to all,

I think the BIOS support for those drives should be removed, too. Programs shouldn't use BIOS calls to find out which GEMDOS drives are available. It's more consistent to use Dsetdrv() (which returns a drive map, too), and forget about the _drvbits or Drvmap() stuff.

Oops. Yes, you're absolutely right -- I wasn't thinking very clearly!
U:\PROC is definitely to be preferred over X:, and similarly new
programs should use U:\DEV instead of V: and U:\PIPE instead of Q:.
I even said that somewhere in mint.doc, but it slipped my mind when
posting about ksh.

Thanks for bringing this up.

For your specific application, it doesn't seem like you need to
sample at a *specific* frequency, just a repeatable one... But from
what I recall, getting anything much past 15Khz requires some
careful instruction timing in assembly. (At 15.75Khz, you can hook
yourself into the horizontal blank interrupt). This is why
Spectrum 512 breaks on fast ST's - essentially they have to change
pallettes at 60Khz. Ergo lots of NOP's.

Not that this would help the initiator of this current thread -
writing a CPX involves a bit more than following certain design
philosophies. It involves running your finished product through a
special program which transmutes it into a CPX. Right now, just
getting the DOCs is a bit pointless - at least with the "Tier II"
you get the software ("but not for very much longer" :-)

|Atari employees would have to show up for work with paper bags over thier
|heads!

I doubt it. I get the opportunity to see lots of documenation from all over
the place from lots of different software and hardware firms. I have seen
some really good documentation and I have seen some really bad documentation.
The Atari documentation might not be top of the line, but it isn't the world's
worst set of documentation.

Why in the world would you expect someone at Atari to comment on a vague,
non-constructive criticism like this?

If you have some specific suggestions for improvements to TOS, why don't
you suggest those? Or better yet, implement them -- the ST has its flaws,
but it is a *very* easy platform to program.

If everyone who had a gripe about TOS actually got together and *did*
something about improving it, we might get a much better OS. (And we
would no doubt have some chagrined programmers who realized just how
hard it is to improve TOS without breaking dozens of programs that don't
follow the rules).

This isn't intended as a flame -- it's a very serious proposal. I agree
with you that TOS has a lot of nasty shortcomings, and I've started to
do something about it (namely, writing MiNT). There are a lot of very
talented programmers in the Atari community; I'm sure that working together
we can fix all those bugs that people don't like in TOS, and add some
nice new features to boot.

Eric, no offense, but the amount of work everyone would have to do to
make TOS half way decent, you mine as well hire someone to design
a new operating environment from the ground up!

I don't take your proposal seriously. Nobody else outside the Atari
world would either, especially NEW Atari customers who are looking at
standardized platforms more and more like the MAC, PC, system 7.0, Windows,
X - Windows, and above all, UNIX.

Any company that doesn't at least support UNIX as a viable alternative is
not going to be around after 1995.

Somehow I don't see MiNT or the ST or TOS even surviving that long.

4036. Emacs 18.57 & Mint 0.91

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-15 09:20:08 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Nov15092008@ghiggins.hpl.hp.com>
Source record: 46474

I just checked out Emacs 18.57 (recently posted) under Mint 0.91 (ditto). The Emacs port is quite robust but there seems to be a significant difference in system i/o behaviour between running under Mint and not.

Some Emacs utilities, such as "dired", are meant to capture output from external (to Emacs) programs, such as "ls.ttp", and read this o/p into a buffer. The i/o between Mint and Emacs seem not to be connected properly, ie ls.ttp is called successfully, runs successfully and the output appears --- but Emacs doesn't seem able to capture it, it simply scrolls past the terminal.

Looks like Emacs isn't capturing the stdio like it should --- BUT this is not the case when _not_ running under Mint --- I checked with "gulam" as the shell in both cases {*} --- so it seems to be shell-independent and Mint-specific.

Anyone have any suggestions as to what might be causing this lack of process communication? Some environment variable which I'm not appropriately setting?

{*} the feature also holds for bash 1.08 and init.prg shells under Mint.

This you call constructive? Whining and moaning about "how awful TOS is" does NO GOOD WHATSOEVER! This is, after all, comp.sys.atari.st.tech; if you have some specific suggestion, or code sample, or even a bug report ("don't do X, because TOS will do the following incorrect thing...") then fine. If you want to discuss alternatives to TOS on the ST (Minix, OS9, Idris) then that might be appropriate, too. Otherwise, take it elsewhere (like maybe comp.sys.amiga.advocacy).

> Because if you ARE a talented programmer your
> not going to WASTE your TIME fooling around with a TOY like TOS.

Gee, thanks for letting all of us who program under TOS know about our lack of talent. (Oh, I forgot, you said "no offense"; you can insult us with impunity now :-().

And thanks for the further constructive input;
I'm sure that if you keep saying this often enough then Atari will see the light: they'll drop all support for TOS, force all present ST owners to buy TTs so that they can run Unix, and the resulting surge in sales will catapult Atari to the top of the computer industry. Right.

I doubt that it's an environment variable. Most likely, Emacs is not using
Fdup()/Fforce() to do the i/o redirection, or is using them in a way that
MiNT doesn't support. If it's the former, the fault is Emacs' (for example,
it may be assuming that certain undocumented basepage locations hold
the standard input/output file descriptors). If the latter, it's a bug
in MiNT. If you find out for sure what's going on, please let me know!

4042. Support for hobbyists

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-15 16:33:09 UTC
From: kbad@atari.uucp
Message-ID: <1991Nov15.163309.21530@atari.uucp>
Source record: 46486

A lot of partially correct information and supposition regarding Atari's support of hobbyist programmers has been floating around here recently. It came about because of someone asked for help writing a Control Panel extension. People have since decried the lack of availability of Atari technical documentation in their B.WaldenNoble bookstore, condemned Draconian non-disclosure agreements, and protested allegedly outrageous prices for obtaining programming information directly from Atari.

In my view, multi-tiered development support was created for 2 primary reasons. It improves the quality of support Atari can provide professional developers, meeting the special needs of professionals for comprehensive and timely solutions to their problems. It also gives hobbyists access to information that was previously costly, only available second-hand, or altogether unavailable to them.

Atari developer support is not, and never has been a profit center for Atari. Developers get stuff from Atari at or near cost. If that cost seems high, it's because it's expensive for Atari. That expense is measured not only in dollars, but in manpower, time, and distribution of limited resources.

Getting back to the issue that started this hubbub, I think it's obvious that it isn't in Atari's best interest to keep secrets about how to develop software on TOS. The non-disclosure agreements between professional developers and Atari are intended to cover products under development. Information on things like TT video, DMA sound, MetaDOS, XControl, and FSMGDOS should be disseminated as widely as possible.

As I think I pointed out during the development of FSMGDOS, broadcasting information about unreleased products would be a disservice to developers and users. That's the reason for the strict non-disclosure agreements between developers and Atari. You don't see open discussions about the internals of multitasking TOS here; it's not ready to have its guts laid open yet. Likewise, Atari wisely holds its cards close to its chest when it comes to unreleased hardware. Development effort is put into a lot of things that never leave 1196 Borregas. It's a lot more important for people to know how to work with the things that do make it out.

The recent CPX discussion in this newsgroup makes it clear that information on current products isn't as widely available as it should be. Someone mentioned that an article in a German publication was written based on dissasembling XControl; clearly we dropped the ball on documenting XControl and how to write CPXs. Sometimes, though, even information that *is* widely distributed gets lost in the shuffle. I

recently talked to someone who didn't know about the GEMDOS extended
argument standard, and that standard was extensively discussed
and broadly disseminated.

We are only human programmer persons, and sometimes we don't follow up
as well as we should. If you find yourself lacking for information,
please continue to let us know about it.

|a new operating environment from the ground up!

That's still nonspecific rhetoric. For machine with OS that isn't even "half way decent," a lot of people are able to do productive work with STs, Megas, STes and TTs. Sure, TOS has its share of misfeatures, but it's had things like device-independent graphics, easy access to low level features (both a blessing and a curse (-:), and straightforward event-oriented programmability from the beginning.

While it's true that mainstream operating systems are outperforming TOS on many counts these days, Atari is not standing still. In any case, the advantage of ST architecture machines has never been software related. The advantage has been raw performance packaged for personal use. The job of TOS has been to enable programmers to make use of that hardware advantage.

TOS is a minimalistic operating system. It's not a minimal operating system; it provides a wide variety of services, but it is minimalistic in the sense that those services are specific and primitive. I hope that as TOS evolves, it will maintain that "lean and mean" feel, and not succumb to unneeded feeping creatures and bloated functionality. The bugs need fixing, but gee-whiz features should be built on top of, not into Atari's OS.

TOS is a piece of work.

GC> Eric, no offense, but the amount of work everyone would have to do to
GC> make TOS half way decent, you mine as well hire someone to design
GC> a new operating environment from the ground up!
I still don't understand what you guys are talking about...
Other then not multi tasking rthe Atari has as good an OS as anyone else and better then most..
(Yes I think my ST's tos is better then system 6 or below.. I can't comment on system seven since The macs I dealt with didnt have it installed yet due to the
major compatibility problems with the software they run..
Its loads better then Dos 5.0 and In full functionality I think its better then the Amigas OS too.. (Except the amiga does multi task...))

GC> Any company that doesn't at least support UNIX as a viable alternative is
GC> not going to be around after 1995.
Unix soon will be available to the masses on an Atari TT/30. I have seen many notifications that its already in developer hands for final beta testing.
The Atari TT package with UNIX should be one of the lowest priced work stations available. And due to its platform and price etc if atari wants to push it hard enough they should sell alot of them since all unix's are pretty much standard and are not much different if they are the same "version".

GC> Somehow I don't see MiNT or the ST or TOS even surviving that long.
MiNT if it becomes very unix like (I didnt use it much..) It could be used as a unix tutorial. Besides for the price he currently is asking I don't think you can complain. ;-)

GC> You bet there are a lot of talented programming people in the Atari
GC> community, PROBLEM IS, they are all leaving us. !!!
Not ALL of them... SOME are and they are normally due to either Atari treating them like crap or they don't sell anything.

GC> When Dave Small, finally says, what the hell am I doing...and one day
GC> he will wake up, Atari is going to be in REAL SAD SHAPE.
This will never happen solely since he is about the most successful developer out there. He has backlogs on everything he sells and is making them
as fast as he can. No, dave will be there until the end of atari and slightly after that I am sure.. And no need to worry if he will be branching off to other platforms since his products are so popular he wont have the time for quite some time to even think about another platform...

GC> Atari is really not doing all that well with thier UNIX release, which
GC> really makes me worry. Because if you ARE a talented programmer your
GC> not going to WASTE your TIME fooling around with a TOY like TOS.
TOS is NOT a toy.. Its a good prelim to the more difficult OS's such as system seven and perhaps Windows... (Note I said more difficult. I still do not think they are any "better" then the current versions of tos. Although the latest versions of each is multi tasking

where as tos is not _YET_ multi tasking.
But also realize that MOST of the problem here is due to programmers working
around the legal limits instead of within. Of course ataris lack of firm limitations as
well as consistancy on all the legal guidelines also has something to do with it..)
Atari is doing just fine with its unix release..
As far as I recall the Apple A/ux (WHich is not "really" TRUE unix) Has some major bugs
that may have been fixed by this time.. But they are making their buyers the beta testers..
I have heard nothing of the Amigas version of unix either.. My understanding is that it too
is available "RSN".
Other then the DOS routes or some of the higher end components there really is not a true
unix available that "I" Know of that will work with multi tasking and multiple users.
The atari version will be available real soon since the developers have it..
Atari learned a while back not to use the users as beta testers. They are trying to wait
until they feel confident that the stuff works atleast as well
as it is supposed ot before it gets released. Ataris track record of things actually
released and working well is quite good. The only Blotch so far that I know of were the Ste
hard drive problems. And that was due to marginal chips.

PS, if YOU don't like atari sell yours and get a "real" computer..
I am an unmotivated talented programmer.
I love my atari but being realistic I also bought a '386 clone.
Since I dont feel like getting "Stuck" with a TT my next purchase will most likely happen
in 1992 when the new machines come out (Hopefully)
either that or I will get a mega Ste AND a newer machine..
And I expect to upgrade my '386 to a '486...

|worst set of documentation.

Yes. The first edition of the dev-docs wasn't that hot, but that's not a rare thing for hardware - the revision of the dev-docs is *much* nicer; it compares favorably with some of the stuff I've seen coming from Microsoft and IBM.

>post you make, _why are you bragging about being the 3rd person in the US
>to own a Mega STe?_

I never said I was sick of Atari? I just complain alot thats all. If I was sick of Atari, I wouldn't bother reading this group. The machine's are missing fundamentals I am pushing to be recognized, so that Atari isn't left out in the cold.

Fact is, my MEGA STE is everything I want in regards to the current software I am writing for the machine. Which is ACICS, a complete communications environment designed for uucp mail, local area networking, file transfers, online games...all that neato stuff. Much of it a modem C programmers dream I would think with auto screen controls for independent terminal control (ie, auto selects VT100/VT52). With the LAN port you can hookup local nodes and talk to each other across lines.....

Anyway, enough patting on the back! :) I use it for Mac software when I want to be REAL serious about writing Docs for the software I write, school, work, all sorts of stuff.

Fact is, I LOVE my ST and we are married. Its going to be with me till its death does make us do part. I have always also wanted to write a good video game, one day I will do that too. But this projectis sort of an on going thing....3 years..on going and going and going....

>
>The way you talk, that entire section should be struck out, and replaced
>with "Saving up for any Unix-based workstation I can afford!", don't you
>think?
>

Well, since you brought it up :) ! I work here at CAE with so many different
machine platforms, HP 9000/325's 425's, SparcStations, Macs GOD thousands
of MACS on this campus, and IBM's as well.

I want a machine that I can:

1) Play games
2) Has great developement tools and widely available documentation.
(The ST has Turbo C, and more or less GCR provides other options as well.)
3) Have FULL access to UNIX a) X11 Programming mainly.
4) Add more CPU and memory power Without my trusty soldering iron...PLEASE.
5) Be able to address at least 16Megs
6) That also has great audio visual capabilities.
7) Costs about 2500.00 bucks.
8) Have the option to develope Lynx games.

Not many machines I work with can do all these things well.

I can think of one machine right now...that might, but not sure...an A3000.

Anybody have any comments? :)

You've got to be kidding! Why would any self-respecting Atari employess wade through this drivel and reply to something like this. It's like saying, "I heard that your I.Q. is lower than your shoe-size, any comment?"

If anyone does, then they should be cannonized. Sheesh. It's not just your message, though. Atar employees would have to take anti-depressant drugs to read these groups lately.

Disgusted,

>increase the size of the screen area to normal size.

There should not be any ill effects, although some color monitors need a one time adjustment to the vertical hold to be able to handle 50 and 60 Hz. However, I would like to point out that a different sync rate should not affect the size of the screen, and that generally the higher the sync rate, the nicer the display (at 50Hz, your eye can register a "flicker", which it tries to constantly adjust for, thus creating eyestrain). The reason the ST mono display looks so nice is that it runs at 70Hz, which is pretty fast.

You can change the horizontal and vertical size of the screen from within the monitor (BE CAREFUL! Lots of juice in there, even when it's off). Some folks do this with their mono monitors, to make them fill the screen. I personally like the higher pixel density when they are left alone.

>please continue to let us know about it.

Ok, you asked for it.
Why not post the complete GEMDOS, AES, VDI information to the net like
apple does?

Please post the information about:
- The cookie jar
- XBRA
- CPX
- How to switch the Mega STE from 8 to 16 Mhz
- The TOS 2.06 and 3.06 release notes
- The new (X)BIOS calls of the TT (same as above?)
- How to programm the second serial port
- What to do with the 'network' port of the Mega STE or TT

As an editor of the Dutch START, it took me a lot of time getting the above
information, mostly from 'informal' sources. Not from official Atari
spokesmen.

Why doesn't Atari spread this information through Bulletin Boards, networks
and Public Domain organisations. I think it only contributes to more and
better (public domain) software.

Bert Rozenberg.

I agree with Ken Badertscher (ames!atari!kbad) in his defense of TOS. I'm a hobbyist/developer with experience on other machines. I'd say the level of support / cost of support is better balanced by Atari than by Apple or IBM (at least that's been my experience). And I still find the ST easier to write for in assembly and in C than I do the MS DOS or Mac platforms.

I don't expect to get rich off this machine, and I don't expect to see millions of these installed throughout the US in the next decade. The majority of computer buyers want one of two (mainly one beginning with *I*) micro platforms. The Atari could offer all the bells/whistles with 5000 MIP X-window system/parallel processing transputer that watches the kids on the weekends and drives you to work, and the average business joe would still demand his/her "PC". Some people never learn.

if you are willing to live with lineA you can interrogate the lineA
vars V_CEL_MY (word at offset -42) and V_CEL_MX (word at offset -44).

for instance gulam uses:
/*
* getnrow() -- get number of rows.
*/

int getnrow()
{
(void)linea0();
return (int)((long)(V_CEL_MY + 1));
}

/*
* getncol() -- get number of columns.
*/
int getncol()
{
(void)linea0();
return (int)((long)(V_CEL_MX + 1));
}

From article <1991Nov15.163309.21530@atari.uucp>, by kbad@atari.uucp (Ken Badertscher):
Writes about Atari support for hobbyists and such:

Read the original please, I don't want to do Ken a disservice in
editing it.

> --
> ||| Ken Badertscher (ames!atari!kbad)
> ||| Atari Corp. System Software Engine
> / | \ #include <disclaimer>

Thank you *publicly* very much for that post Ken. It was a
great relief from the whining and flame wars! You had cause to
complain, yourself, but instead, you apologised for something that
isn't really your fault, BRAVO!
I do have a couple of questions though. If you and your
fellows are the only sources of atari tech info, where do you
generally release the stuff you want programmers to know? I know the
Xargs protocol was posted here, could other things be regularly
posted? If that isn't possible, could you at least post where such
information is to be found - my feeling is that Useneters could be
trusted to repost *unofficially* any public information gained from a
sanctioned forum (e.g. GENIE or wherever). I'd act to make sure that
the source of Tech info was put into the monthly FAQ posting if you'd
like.
A second thought would be for Atari to fund the translation
(into English - the modern lingua franca I guess, though I could just
manage French 8-) 8-) of German 3rd party books that it likes, and help
an outside publisher to distribute them worldwide (through Atari
dealers and/or distributers or subsidiaries). Claus Brod's book
comes to mind here (I know, I know, you've had your disagreements in
the past).
Last question, anybody in the know can field it. What is the
hobbyist developer situation currently - what do you have to pay, what
do you get and for how long. What is the situation outside of the
U.S.A?

Thanks again,
Bob Pegram (really wasting my time on news today!)

Unfortunately this is totally incorrect. The real ANSI specification
is:

#include <stdio.h>
size_t fread(void *ptr, size_t size, size_t nmemmb, FILE *fp)

One of essential differences is that size_t type should be defined
in a such way that you do not have problems with 32K or 64K limits.
Please note also 'void *ptr' instead of 'char *'.

don't know about meta dos (you mean meta dos is free and the docs
aren't top secret either? :-) , but maybe a /dev/tape could be
implemented as .xfs (external `filesystem') for MiNT? chances are
that would even work with the GNU tar thats already on atari.archive,
as long as one just sets its block size -b big enough.

> Michal Jaegermann
> ntomczak@vm.ucs.ualberta.ca

That's what I get for relying on a version of Harbison & Steele that
was written before the standard was firmed up.

However, size_t is defined in the dLibs stddef.h file as follows:

typedef unsigned short size_t; /* sizeof() value type */

... which leaves you stuck with the equivalent of what I described:
a maximum argument size of 64K. :-(So far as I know, the value
returned by sizeof() is hardwired in hcc.

The issue of the void pointer is something I ran into tonight while
messing around with the MiNT library sources. Both MiNT and dLibs
sources increment the pointer value through addition. The version
of Sozobon C that I'm testing regards a void pointer as one that cannot
be incremented, because it has no size. (Previous versions also may
act that way, but I don't have one online to check.) Anyway, the
fread and fwrite sources from mntlib14.zoo choked hcc until I reached
in and changed void * to char *.

I'm not sure what to make of the hcc error message. I suppose I should
post a message to comp.lang.c and/or comp.std.c.

That's not a very useful approach under TOS -- since TOS doesn't support
a termcap mechanism. The line a approach that bammi described works fine
with STs.

I've also tested it with the Moniterm large-screen monitor driver and with
the Image Systems large-screen board in a Mega 4, and it worked fine
there, too.

It may or may not run into problems on a TT -- I have no idea how far
Atari has backed away from line a in the newer machines.

|The Atari TT package with UNIX should be one of the lowest priced work stations available. And due to its platform and price etc if atari wants to push it hard enough they should sell alot of them since all unix's are pretty much standard and are not much different if they are the same "version".

Hopefully. The recent collapse of PC clone prices has made it possible for someone to buy a big (386) PC with UNIX for about $2k(*). This presents a problem for the non-PC cheap Unices, since on the PC, you can run a dos-compatability program without growing old and dying.

|As far as I recall the Apple A/ux (WHich is not "really" TRUE unix)

Sure it's a real UNIX. The graphical interface and the mac-os glue doesn't make UNIX not UNIX.

|I have heard nothing of the Amigas version of unix either..

I've heard from Amigoids that the thing is available. Not having a (working) Amiga, I'd not know for sure, but I'd believe them.

(*) Assuming, of course, that you _buy_ the copy of UNIX. If it's a "liberated" copy, all you need to buy is the hardware - and then you can get a '486 with UNIX for $2k. Distressing. A '030 is a match for a '386/'486, and could compete in an environment where you don't need DOS compatability, unless it costs more than the corresponding '[34]86 :-(

>the ST/TT!! Geez, just release the docs!!

Richard,

Please write a letter to Leonard Tramiel at Atari telling him that you need
docs, and why you need them, and that you believe Atari is hurting itself
by prohibiting the release of developer info.

Note that in most subsidiaries there is also developer support, and you could
write to the Atari subsidiary in your country as well.

Once you are registered as a developer, you *do* get info, but I realize that
this is no solution for most ST owners who just want to program a bit.

Does this mean that I can stuff all the files from the XControl developer disk into an archive and post it to the world? :-) I might just do that, but if that's really true I'd rather have Atari do that ...

>[...] Someone mentioned that an article in a German publication was
>written based on dissasembling XControl; clearly we dropped the ball on
>documenting XControl and how to write CPXs.

Yes, what I didn't mention was that these people probably were motivated to disassemble the things because they wanted to be the first to publish CPX information (all German ST mags have access to developer info).

I got your text file that included C fragments from Atari Germany and, while I never wrote a CPX based on that info (and you extended the specs later), at least I knew the Atari-endorsed names of the functions etc.

What this discussion really has been about was that people want to go out and buy Atari-endorsed documentation off the shelf, something they can do for all other major PC-market architectures.

This problem is not solved by a few nice people like you who help users on the net by answering questions. It's a question of corporate policy.

Is there a PD CLI program that could be used to batch convert a few ARC to ZOO or LZH archives..

ie, stick a few ARC files into a Folder then run a batch file cli to convert them to LZH201 or the new ZOO2.1..

The Neodesk Cli will do this but is not PD..

Thanks !

Ftp and try CLI.LZH from atari.archive.umich.edu in /atari/cli
This is a cli with lots'o'build-ins. The docs are in german, but most
of the commands are self-explanatory.

Simple batchfiles are noprob for cli. Have fun!

4070. high performance file transfer

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-18 16:00:41 UTC
From: clj@ksr.com
Message-ID: <7077@ksr.com>
Source record: 46405

Now that I'm using a V.32bis modem, I've become more interested in maximizing my file transfer throughput. I've been using Kermit with 1000 byte packets, which has been OK, but I'm interested in seeing if I can do better. Here's my setup:

I've got a 1040 STf with TOS 1.0 and a USR V.32bis modem. I typically am doing the transfers between a Unix system (SunOS 4.0 something running on a Solbourne). The Kermit I use on the Unix side appears to be version 4E(072). The {X,Y,Z}modem I have available on Unix displays

sz 2.02 04-27-88 for V7/BSD by Chuck Forsberg, Omen Technology INC
"The High Reliability Software"

On the ST side, I've been using Uniterm 2.0e11 (I think) and its builtin kermit.

Looking at atari.archive, I see various transfer protocols, but I'm unable to get any of them to work. I've been trying to get either Ymodem-G or Zmodem to work. I've tried cts_zmdm.lzh, gszrz17.lzh, xyz201.lzh, ymg125.lzh, and zmdm168.lzh. I've installed turbocts.prg, and turned on CTS/RTS in the modem, but no go. Does anyone use any of these sucessfully? Do you have any pearls of wisdom to share that could allow me to get one of these working?

$1000 BRA $10
> When the program counter is at $1000, it fetches the BRA instruction,
> and then the program counter is incremented to $1001 so that the
> CPU can fetch the operand, in this case $10. After that the
> program counter is automatically incremented again.

Close. Jeff is familiar with the 8-bit processors, but the 68000 grabs a word of instruction at a time. So at the time "PC" is being evaluated for a branch or pc-relative address, it is one word (2 bytes) past where the instruction was placed in memory. Indeed the 68000 doesn't fetch the BRA instruction "then" the "operand" - the "operand" (displacement) is built into the BRA instruction (for 8-bit branches). A 16-bit displacement has an extra word of instruction, but the value of PC for each instruction for the 68000 is always after the FIRST WORD of an instruction is fetched, regardless of how many extra words are needed for extended addresses. So a branch (long or short) to the same line is -2.

Typically for pc-relative addressing or branches this is handled by your assembler. You would use labels, as bra Loopstart or pea Msg(pc).

4075. Re: TOS is a piece of...

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-18 23:50:00 UTC
From: simonk@castle.ed.ac.uk
Message-ID: <14974@castle.ed.ac.uk>
Source record: 46413

As one of those who orriginated the current discussion about TOS and
its quality or otherwise :-) I would like to make my views a bit plainer
than the previous (rather short !) article was capable of doing.
For a start I agree with Eric that if you don't like something you
should try to change it for the better rather than just moaning about it!!
Second point >defective version of MS-DOS< is probably (more than a
little) harsh. A more acurate description is probably a slight
enhancement of MS-DOS !

Now for the actual criticisms of GEM/TOS (these are fairly technical
which is the reason why I am posting this article to
comp.sys.atari.st.tech and not comp.sys.atari.st)
Firstly there is nothing fundamentally wrong with either GEM or TOS
its just that the degree of communication between the two is minimal and
neither has had a *major* upgrade before TOS 3.0/2.0 (I regard TOS
1.4/1.6 as a complete version of the original rather than a major
upgrade).
To expand on this TOS has no knowledge of GEM`s multitasking
capabilities with respect to (or indeed the existance of) DAs or of other
advanced features provided at the higher level. Another (infamous) example
is the resolution change "bug" which means the machine must be rebooted in
order to change the screen resolution because GEM does not understand that
TOS has changed it.
The problems due to lack of a major upgrade basically all stem from
the isolation of TOS and GEM from one another as far as facilities are
concerned. New upgrades could have given us things like event calls to
watch for data coming through the input ports, a degree of multitasking
(at least for legal GEM applications), propper clipboard facilities etc.
To put it another way an ST has two levels of IO routines and two kernels
both of which fail to fulfill the possibilites of their design. This two
level system leads to unavoidable clashes between programs eg when two
programs whish to use one IKBD timer they have no way of knowing a bout
the clash of interests and continue regardless (this, I guess, is the
reason many calendar DAs crash under MiNT). This could be resolved but
at the DA multitasker is in GEM and the IKBD routines (what few there
are) are in TOS it is not. This sort of thing is OK on machines where
the text based system has a GUI bolted on by the user but when the two
systems are burnt into ROMs it would be nice to see some fusion between them.
I appreciate that the reasons behind the rushed appearance of TOS and
GEM are political and made developement impossible for a while but I
cannot help wandering what would have happened if DRI or Atari had kept
up developement of the OS over this period. Now Atari have sole
responsibility for the system we appear to be seeing improvements in
most of the really weak areas eg GDOS, multitasking, DA slot shortage

and no-longer-very-impressive graphics.

Finally (phew !!) to give my personal answers to questions raised in this debate:
I do not think TOS/GEM is a toy OS just a little dated and in need of improvement.
I would like to say again that it is basically up to us (hopefully with Atari's help) to improve matters.

Apologies for the rather abrupt nature of my original posting. Hope this makes my views clearer (or at least muddies the issue completely :-)

:-) Simon Kinahan aka simonk@castle.ed.ac.uk (-:

I was informed via email that the best way to do this is through the
termcap mechanism. With this, programs can check the value of ln# and
proceed accordingly.

Actually it's "li#", but I'm not here to pick nits...

The benifits to using termcap are obvious (portability). However,
there are a few disadvantages to be noted:

1) Not everyone uses termcap-based software on their ST, so they may
not have a termcap file. Make sure you include one with any
termcap-based software (One that at least has an entry for the ST.)

2) You can only have one "li#" for each terminal, so if you change
your terminal attributes (i.e. switch to 50 lines) you'll have to
change your TERM variable to point to a new description.

3) termcap supports a "tc=" option to point to a similar terminal
which would make it easy to write a very short description for the
50-line version of the ST's vt52 emulation ("st52-50:li#50:tc=st52:"),
but that doesn't seem to be supported in GCC's termcap library. Can
anyone else verify this, or am I just imagining it? (I haven't read
the source code, I just noticed that none of my termcap-based programs
work if I use an entry with a "tc=" option. And yes, I do have it in
the last position...)

hcc is ok here, gcc has a special extension that considers
void * as a char * in address expressions. gcc -pedantic will point
such things out.

you seem to have a corrupted binary. error -66 is usually due
to an invalid .prg header.

>thing is happening, but why ?
```

I don't know what is happening, but I don't think it can be a NMI
because the ST supposedly has the IPL 0 input permanently set to 1.
Maybe if you try to run it on other ST systems, you can find out
what's going on.

Jack

> well then what does hcc have to say about
> char c[65536+1];
> sizeof(c); ??
>

It says 65537. I wrote a little test program:

#include <stdio.h>

char c1[65536+1];
char c2[65536L+1L];
char c3[800000L];
main()
{
printf("size of size_t is %u bits\n", 8 * sizeof(size_t));
printf("size of sizeof(void) %u bits\n", 8 * sizeof(sizeof(void)));
printf("size of void is %u bits\n", 8 * sizeof(void));
printf("size of c1 is %lu bytes\n", (long) sizeof(c1));
printf("size of c2 is %lu bytes\n", (long) sizeof(c2));
printf("size of c3 is %lu bytes\n", (long) sizeof(c3));
printf("size of sizeof(c3) %u bits\n", 8 * sizeof(sizeof(c3)));
}

... and the result was:

size of size_t is 16 bits
size of sizeof(void) 8 bits
size of void is 0 bits
size of c1 is 65537 bytes
size of c2 is 65537 bytes
size of c3 is 800000 bytes
size of sizeof(c3) 32 bits

... which I suppose suggests that -- at least with the version of Sozobon
I'm using -- size_t ought to be typedef'ed unsigned long, right?

(Earlier versions of Sozobon may give different results. I know the sizeof
operator has undergone some revision; some versions of Sozobon always return
the size of a pointer when sizeof is applied to an array.)

4081. ST Notebook (was Re: help with info)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-19 07:50:17 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <15823@uhccux.uhcc.Hawaii.Edu>
Source record: 46410

Thanks for the great review of the Notebook! There are some things
that I would like know:

1) Was the Notebook ever operated from completely powered-up
condition to zero power? How long did it last to go to
both extremes and how did it behave during that time?

2) Does the Notebook have a SCSI bus?

3) The 2.9 kg weight includes the weight of the battery pack?

4) Does the case have any mechanical weak points? I read
that Toshiba made the Notebook for Atari and was wondering
how well they did it.

Thanks again,
Jack

4082. Gulam ue bombs

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-19 08:43:38 UTC
From: mpark@milton.u.washington.edu
Message-ID: <1991Nov19.084338.4019@milton.u.washington.edu>
Source record: 46418

Is it just me, or has this ever happened to anyone else:
I'm editing a file with Gulam's ue, I decide to quit without saving so I
hit ^x^c, ue asks me if I want to save, I say 'n' and *poof* I get bombed
back to the desktop! This only happens once in a while. It's no big deal,
but if there's a simple way to avoid this nuisance, I'd like to know!

4085. GDOS driver information wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-19 13:12:49 UTC
From: dba@jet.uk
Message-ID: <1991Nov19.131249.1919@jet.uk>
Source record: 46422

hi atari netters,

I require some help with regard to drivers for GDOS. I have a NEC2200 24 pin printer capable of 360*360 dpi graphics, but am only able to use it with the epson.sys driver (at 180*180 dpi). This is the driver received with my version of GDOS (v1.1).

Rather than hack into the epson driver, I need information regarding the functions of the driver and/or any source code for me to change to use the full capability of the printer?

I assume that the driver is given a string to print. Looks up the bitmaps for the characters from the font file and constructs a data stream to output to the printer?

I have the information about the construction of the font files and can make the necessary fonts for the printer.

This information is also required to drive a Canon BJ10e printer.

Thanks
Dennis Armstrong

A feature. mntlib will automatically convert /dev/c\bin\foo.ttp into c:\bin\foo.ttp whenever you use that name (e.g. in open() or stat()).

The reason this is happening is that POSIX specifies that ':' is the path separator, and most UNIX type programs expect this also. So mntlib automatically converts a path like
PATH=c:\bin,d:\gnu\bin,
into
PATH=/dev/c\bin:/dev/d\gnu\bin:

When you spawn() a program PATH is converted back into the old form, so non-mntlib programs can still use it.

If this feature is undesireable for you, please let me know.

4088. Re: Sozobon C 2.0 (I only only know what I read)

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-19 18:06:10 UTC
From: steve@thelake.mn.org
Message-ID: <A1623529331@thelake.mn.org>
Source record: 46426
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just mailed (uuencoded) Sozobon C 2.0 to atari.archive and to
the moderator of the binaries and sources newsgroups.

The files are:

----a 148480 19.11.91 05:17:46 scbin20.lzh
----a 33792 19.11.91 05:44:30 scdoc20.lzh
----a 205824 19.11.91 05:29:00 scsrc20.lzh

This is NOT the version I've been testing. I don't know anything about
it that you can't read in the docs.

The docs indicate that it incorporates various bugfixes and provides one
notable extension: Sozobon no longer is limited to eight significant
characters in external identifiers (a limitation inherited from Alcyon C).
The new compiler has an extended object module format. It is designed
such that the new linker-loader can understand both original DRI-format
libraries and objects, and the new Sozobon extended format.

The new compiler apparently does not include the many improvements that
Ian Lepore has introduced into his version. It's hard to imagine, but
in this electronic age there seems to have been a major failure to
communicate. Let's hope that Ian and Tony Andrews can consolidate their
versions quickly.

> 1) Was the Notebook ever operated from completely powered-up
> condition to zero power? How long did it last to go to
> both extremes and how did it behave during that time?

Yes, it has; with _*NO*_ power management at all, with the Screen a highly detailed, dithered image, and with the hard drive spinning-up every five minutes and running for a minute [running a FlightSimulator Demo, if you want to know]...
The STBook ran for over five hours, before fading away [because power management handles Save-and-Resume, it of course didn't happen]

With power management, the people at the Shows have been getting 8 to 10 hours, and I still have a few tricks left to extend the power even further (just software, so y'all will have them in good time)

> 2) Does the Notebook have a SCSI bus?

No, but the ACSI/FDD (what I call Pseudo-ACSI) connector has all of the ACSI signals, so ACSI-to-SCSI convertors can be used.

> 3) The 2.9 kg weight includes the weight of the battery pack?

1.9 Kg, actually, and yes, it includes the Nicad-battery pack. The machine is some 200-300 grams lighter with an alkaline pack.

> 4) Does the case have any mechanical weak points? I read
> that Toshiba made the Notebook for Atari and was wondering
> how well they did it.

Toshiba is assembling units for us, but we did the design. The one area I would point to as weak is the cover "clasp" (i.e. that holds the unit closed). The "hinge point" for is is not the strongest, _and_ it doesn't move in quite the way you would expect (i.e. it barly moves at all). This cause excessive force to be used, and the hinge points can break. This is being worked on. It should be noted that the hinge has never been broken by those who knew how it worked; it has always been broken by some #$!#!@&* coming up, grabbing it, and yanking it open, saying some like "Here..Gimme...Lemme See.. Yeah, I know how..."

------------------------------]
Neither do I.

>because the ST supposedly has the IPL 0 input permanently set to 1.
>Maybe if you try to run it on other ST systems, you can find out
>what's going on.
Nope, that's not machine specific. The MC68040 manual sez level 7 (not 0) is NMI, assuming that we had a $2300 in our SR registers, the interrupt shouldn't show up anyway (but it does). Level 0 might just be NMI in that sense, that it isn't a real interrupt and therefore not usefully (and effectively) maskable.

This is from the MC68040 users manual (assumming that the 68000 is about the same in its IRQ handling (except of course stackframe size)):
"When processing an interrupt exception, ...
...the processor attempts to obtain a vector number from the interrupting device ... For a device that cannot supply an interrupt

vector, the autovector signal !AVEC can be asserted. The MC68040 uses
an internally generated autovector, which is one of vector numbers
25-31.. If external logic indicates a -bus error- during the irq ack
cycle, the interrupt is considered spurious, and the processor generates
the spurious interrupt vector number, 24." (<<<!!!)

I received up till now one very good mail message from some guy in Berlin,
who has a theory why this happens. It doesn't coincide with mine, but who's
to say he's wrong ..?

Nevertheless I am still highly interested, whether this behaviour is
1. already widely known, and a workaround does exist
2. due to some mistreatment (by me) of the MFP
3. bona fide MFP bug

Actually its not really dependent on the MASK register, I got a similiar
effect with the PENDING register too, just polling BUSY via IPRB waiting
for an ACK and then clearing the pending bit. (TOS does polling by looking
at the line directly, I believe)

>Jack
Nat!

PS:
MC68040 users man again:
"The !IPL0-!IPL2 interrupt signals must maintain the irq level until
the MC68040 acks the irq in order to guarantee that the irq is recognized.
... An IRQ that is held constant for two consecutive clock periods is
considered a valid input."
But this wouldn't force a spurious interrupt, would it ?

>What is the Current Notes and where is it available?
>
>Thx

Heehee, funny you should ask. Current Notes is a magazine for Atari computers. I would estimate that 80% of the coverage is for the ST/TT line, with a little bit of 8-bit stuff thrown in. It started out as a users group newsletter, and has grown into a fairly hefty mag. The magazines end up being mostly software reviews (real reviews, not based on advertising dollars), with some articles (Dave Small writes for this mag, by the way) thrown in for good measure. I really like J. Andrejz Wrotniak's articles (he is VERY critical in his reviews and recommendations, and has saved me big $$$$ in the past). They also have the best PD library for the ST that I have had experience with. They take the time to make sure everything works on the disks (and that they have no viruses), and they will update versions of stuff if you mail the disk back. Another thing I really like about the mag is that they print an index of articles every year, so you can look stuff up easily. I liked the mag (and the availability of the index) so much I bought all the back issues. I refer to my "CN library" quite often to dig up answers to questions posted to this group. Every issue has a bunch of ads in it from mail order outfits (something harder to find nowadays). Anyway, with all this said, I find that I do not have the phone number for the mag with me. I will post the phone number and address with which to obtain a subscription this evening.

There are two things that have made my ownership of an ST something other than an expensive mistake. One is comp.sys.atari.st, the other is Current Notes. Without these two resources, I would have gotten rid of my ST years ago. I have given away subscriptions to several ST owners over the years, and they have all renewed their subscriptions after my gift ran out. It really is a great magazine. There is at least one Atari computer store up in DC that gives away a subscription with each ST they sell, and I understand the renewal rate is very high with these subscriptions also.

I am not connected with CN in any way, other than as a satisfied customer.

>Stig Vidar Hovland - stigvi@lise.unit.no

Funny you should mention that; I just encountered this myself. The answer is that after using findfile() you have to call _unx2dos to turn the result into something that TOS or MiNT system calls will understand. All the file calls in the library (open, fopen, remove, etc.) will call _unx2dos for you, but if you want to use the string yourself in a kernel call, or pass it to someplace where it won't get _unx2dos'ed, you have to _unx2dos it.

The reason for the /dev/ syntax is that MiNTLIB's startup code turns the PATH environment variable into something acceptable to POSIX programs: no drive letters, forward slashes separate pathname components, and colons separate the directories on the path.

SYNOPSIS: int _unx2dos(char *unx,char *dos);

Takes the string specifiec by "unx" and un-unixifies it: a leading /dev/x is turned into x: and slashes are turned into backslashes. The destination string had better be long enough to hold the result. Returns nonzero on error.

In MiNTLIB, that's about all this call does; in Bammi's GNU libs, _unx2dos is the thing that deals with UNIXMODE. Eric Smith says UNIXMODE is a crock and I agree; Eric should know since he conceived of it (and wrote it?). It belongs in the kernel (under Trap 1), not in the library (above it).

No, it is not undesireable. As Allan Pratt suggested, I can use _unx2dos() to convert. (As I have already done...) But what is the point in converting to POSIX in the first place. I know it will be easier to port POSIX programs to the ST, but it will also be harder to write/port TOS programs.

Anyway, I realy appreciate all the work you have done for all of us. MiNT_Lib and MiNT are great!!.

4097. MiNT and quickst

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-20 18:42:32 UTC
From: willing@pantheon.icsl.ucla.edu
Message-ID: <4847@lee.SEAS.UCLA.EDU>
Source record: 46438

First off, thanks Eric for MiNT--it is very useful and impressive. However, I find it frustrating that I can't use MiNT and quickst at the same time. Without quickst, my ST is a real worm. After spending the day in front of a SparcStation or NeXT, the screen response (bios text) is unbearable.

I realize that quickst is most likely to blame, but has anyone figured out why? From looking at the MiNT kernel code, it appears to call TOS's Bconout() when text is written to the console screen. From the way MiNT initializes, it appears that any altered Traps from the auto folder should still be intact at the time Bconout() is called. Is quickst hooking into the system at a point other than the trap or is it playing games with vectors when it is called? Does anyone have an alternative "text accelerator" that works with MiNT?

Thanks,
Scott Willingham // willing@icsl.ucla.edu

> to the ST, but it will also be harder to write/port TOS programs.

It really shouldn't be much harder; not many TOS programs need to use the PATH environment variable directly (as opposed to indirectly through spawnvp or fopenp); it's more common in Unix programs. If you use the stdio file routines (fopen, etc.) or the Unix emulation routines (open, etc.) then the result of findfile() can be used directly; so the only time there's a conflict is when a program uses findfile() and calls TOS/MiNT directly via trap #1. I don't think that will be a very common occurence, since I don't think that findfile() is standard in TOS libraries. Using open() or fopen() is preferred anyways, since it allows the use of forward slashes (/) instead of backwards slashes (\) in paths.

>comprehensive and timely solutions to their problems. It also gives
>hobbyists access to information that was previously costly, only
>available second-hand, or altogether unavailable to them.
>
>Atari developer support is not, and never has been a profit center for
>Atari. Developers get stuff from Atari at or near cost. If that cost
>seems high, it's because it's expensive for Atari. That expense is
>measured not only in dollars, but in manpower, time, and distribution of
>limited resources.

Ken, I don't mind paying for the info (admittedly it does SEEM a bit steep), my gripe was the non-disclosure agreement. I know you say that there should be a 2 tier system to cope this this, but Atari UK doesn't seem to have one, as far as I could find out. (I was put in direct contact with Alistair Bodin, ProSupport Manager, Atari UK. I told him that I was a mere hobbyist, but he said that there was, to his knowledge, only the ProSupport scheme).

>
>Getting back to the issue that started this hubbub, I think it's

I must be doing something wrong.... Is anyone else having problems
running elvis under mint? (I am sorry, I'm not using the one-true-editor yet)
I recompiled Elvis with changes so I have a version that runs under Standard
TOS and then another that runs under Super-TOS (mint). In order to use
the mint library, I downloaded and set up GCC and G++. I followed all the
examples, however I can't even compile and linke a hello world type program.

I don't get an error message it just returns. some thing is wrong.

I've setup to ksh and using the example I will either put the MWC directories
in the path or I will use the gcc directories. Under Mint, I can't get either
compiler to work properly. most frustrating.

Is there good documentation (ie source) for mint mgr. I would be real
interested in determing the size of the current mgr window after a resize.
I'm changing the elvis code to use a real termcap and curses code, but
I need to find the locations in MGR that reflect the current height weight
so elvis can resize the window.

After, I get elvis, ksh and perl working then I can start working a fast
implementation of data base and data entry system. Mint is so much
better than the rest of the ST world....

Is there something else wrong with my system. If I use gem.prg as my
init.prg then the system locks up. How should I access (yuch) the desktop
from mint.

How does one access zoo under mint/ksh. The command "zoo a// zoo files"
gives an error message "improper option \".

My dealer tells me that I have 2 1/2 megs of memory, however whenever
I run a program that tells me the amount of memory left, I am told from
a bare desktop that I have 1700K left. Is it using that much memory,
or is my system not recognizing any of the orignal 1040 memory besides
the additonal 2 Megs of memory. How do I verify memory availablity.

How do I write Mint compliant code;

Use Mintbind.h, and link with the mint libraries. Don't use code
that assumes total domination over the machine. Has anyone ported
microemacs 3.10 (or .11) to mint/mgr yet?

4104. Problem with PC-DITTO, 40 Mb ICD, DOS 4.0: Divide Overflow

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-20 21:45:31 UTC
From: florijn@serc.nl
Message-ID: <10543@serc.serc.nl>
Source record: 46344

Hi,

I'm having problems with PC-DITTO and a 40 MB ICD harddisk (connected to an old 1040 ST). I want to use the GEM partitions from within DOS (booting DOS from floppy); booting DOS from hard disk might be an option later on. I have four GEM partitions, all of which are roughly 10 Mb in size. Launching PC DITTO works, DOS boots just fine (DOS version 4.0). However, if I try to access data on drive C: (using DIR) I get "divide overflow". The same thing happens if I access any of the other drives (using the PC_DHD.SYS driver).

I suspect that this may be a compatibility problem but I'm not really sure. Is the partition too large? Should I use a different version of DOS? Perhaps format one of the partitions to boot DOS??

Any help is appreciated, but please use E-mail for answers.
If there's sufficient interest I will post a summary.

You get this error when an executable file isn't executable anymore. For example, a corrupted program file will give this error. Another common one is TOS error #35. You could simulate the error by renaming a text file to a .PRG file. The error will be generated. Good luck...

You might have been screwed by the ZOO program, which turns dashes '-' in filenames into underscores '_' when extracting files. GCC wants its support files to match $GNULIB/gcc-filename, and if it doesn't find them it gives up.
>

I had no trouble using MWC under MiNT. Of course, I was only using Gulam, not a MiNT-aware shell.

> so elvis can resize the window.

The full source should be available wherever you got the binaries. There is an MGR command that returns the current text screen dimensions. (ESC 2 I, in fact. I put the following aliases in my .cshrc on the Unix boxes I use:

```
alias mfont 'echo -n "!\!:1F"'
alias mgsize 'stty -echo;echo -n "^[2I";set c=$<;set coords=($c);stty echo cols $coords[1] rows $coords[2]'
alias mgterm 'stty -echo;echo -n "^[1I";setenv TERMCAP $<;stty echo'
alias mssize 'echo -n "^[!!:1,!!:2w";mgsize'
```

mfont selects a font, mgsize gets the current text screen size, mssize sets the text screen size, and mgterm sets my TERMCAP variable.)
>
> After, I get elvis, ksh and perl working then I can start working a fast

Dunno, sounds like zoo is flaky and doing unx2dos conversion on its command
line options instead of just on file arguments.

Bare desktop meaning no desk accessories? What program do you use that tells
you how much free memory is left?

>Its much better than ANYTHING Atari puts out. Plus you get an OK compiler.
>(YOU MUST HAVE A HARD DISK FOR MWC THOUGH...)

Not entirely true, if you have double-sided floppy drives and at least 1 MB of RAM you can use the compiler, but you'll be swapping floppies a few times... (The 1MB minimum is so you can create a 256K or so RAMdisk and put temp files and some compiler passes there...) I used it this way when I first bought a 1040, 5 years ago. (Of course, I also bought a 2.5M RAM upgrade and a 20M hard drive within 2 months after that, 'cause I couldn't really stand it...)
>
>Does anyone know if Atari gives you the Mark Williams Manual with the
>compiler if you become a developer?

Yes. You get the 3.0 manual. Pretty nice.
>--
>Gosh how the moods of people change over the course of a few minutes!

Hasn't your system administrator told you that signature files aren't supposed to exceed 4 lines of text? Regardless of that, don't you think 14 lines of spew is just a tiny bit excessive?

Actually the important variable is GCCEXEC. The main CC program
pastes the value of GCCEXEC onto the front of the name of a particular
part of the compiler. For example, if GCCEXEC is
"/dev/C/usr/local/gnubin/gcc-" and it's time to run the loader phase
(ld.ttp) then gcc will try to run C:\usr\local\gnubin\gcc-ld.ttp.
Note that if you don't want to use a prefix such as "gcc-" you must
have a trailing / or \ on the value of GCCEXEC--it will not be
automatically inserted. So, if you unpack with ZOO 2.01 and don't
want to rename all the files, simply set GCCEXEC to
"/dev/C/usr/local/gnubin/gcc_" (assuming your gnu binaries are in
C:\usr\local\gnubin). Note that you will still have to rename some of
the include headers and libraries. I suggest getting zoo 2.1 which
doesn't mung filenames like 2.01 did.

>> How does one access zoo under mint/ksh. The command "zoo a// zoo files"
>> gives an error message "improper option \".
>
>Dunno, sounds like zoo is flaky and doing unx2dos conversion on its command
>line options instead of just on file arguments.

Actually, ksh translates all "/" to "\" in the command line. Zoo is
not to blame. If you use "unixmode zoo x// file.zoo" it will work
correctly. It sounds as if the original poster has not read the docs
distributed with ksh. Tsk, tsk.

Do the compilers work OK under TOS? If so, have you tried using the same shell and other setups under MiNT? My guess is that ksh may not like some of your environment variables (see below). [You also don't mention the version of MiNT; is it 0.91? If so, the TOS version of elvis ought to work, I think.]

> Is there good documentation (ie source) for mint mgr. I would be real
> interested in determing the size of the current mgr window after a resize.

FTP to flash.bellcore.com; in pub/mgr there's a ton of mgr source code and docs. (Aren't the usrman.out documentation and the mgr libraries included with atarimgr.zoo? These should also answer your question.)

> I'm changing the elvis code to use a real termcap and curses code, but
> I need to find the locations in MGR that reflect the current height weight
> so elvis can resize the window.

MGR doesn't have any locations :-). What you want to do is send a string to MGR saying "I want a TERMCAP entry"; MGR will then send you back a complete TERMCAP entry (include li# and co#) for the current window. The string you send is <ESC>1I; you have to make sure the terminal is set up correctly (i.e. not in raw mode) before you send the string and try to read the (1 line) reply. The mgr library routine char *get_termcap() does all this for you.

> Is there something else wrong with my system. If I use gem.prg as my
> init.prg then the system locks up. How should I access (yuch) the desktop
> from mint.

What's your system like? (TOS version, MiNT version, what's in your AUTO folder, what .ACCs do you have?) This definitely shouldn't happen. You could try removing .ACCs and AUTO folder programs to see if there's a conflict. You could also try removing init.prg; if none is found, MiNT (0.9 or higher) will boot into the desktop instead.

> How does one access zoo under mint/ksh. The command "zoo a// zoo files"
> gives an error message "improper option \".

ksh translates "/" to "\" automatically, which is usually what is desired
but sometimes causes problems. See the readme.st file that comes with ksh
for how to turn this translation off. Also note that ksh uses \ as an
escape character, so doing PATH=\bin actually sets PATH to "bin"
rather than "\bin" as intended.

> My dealer tells me that I have 2 1/2 megs of memory, however whenever
> I run a program that tells me the amount of memory left, I am told from

> microemacs 3.10 (or .11) to mint/mgr yet?

The use of the MiNT libraries and mintbind.h are optional, really -- they
let you take full advantage of MiNT, but most ordinary TOS programs should
work OK under MiNT as long as they don't make assumptions about memory
ownership and "domination over the machine", as you say.

>usefully (and effectively) maskable.

A level 7 (NMI) interrupt occurs when /IPL2, /IPL1 and /IPL0 are all low,
but the GLUE of the ST can't generate a NMI because it only has the /IPL2
and /IPL1 outputs while the 68K has its /IPL0 tied high. Since you said
you've had the problem for several years, I am assuming you are talking
a 520/1040 ST and thats what my ST Internals book indicates about it.

If you have the STe models, then the MMU-GLUE (MLUE) provides for all of
the /IPLx signals.

>

It seems to me that if you had set the mask register to prevent mouse/key-
board interrupts, then either the MFP is faulty or TOS/debugger reset it
behind your back! Another guess is that you should reseat your GLUE chip
firmly back into its socket, because it might be another factor for the
flakiness.

Jack

From: luoto@cs.Helsinki.FI
Message-ID: <20941@hydra.Helsinki.FI>
Source record: 46354

Hey, what are all those DIPSWITCHES for ??? -flashed into my mind, when I replaced my old TT:s internal disk drive with a HD-one ???

I dipped the number 7 up as I was told that should bring a HD formatting ability to tos, yes it did, but since I got a 3.01TOS that wont do any good !!! (wont work) ALSO this little thingie is doin' all kinds of funny things that normal nice computer is not supposed to do like: not being able to check info on HD-disks, NOT being able to write more than a meg on those hd disks, NOT being able to read from inside folders on disks... and so forth

has anyone had similar problems, and are they all because of the TOS version ?

-anyone got TT internals or something... to check those dip's out ?

-> why do they newer live up to your expectations ?

4118. Zoo and Zip file formats

Newsgroup: comp.sys.atari.st.tech
Date: 1991-11-21 18:03:29 UTC
From: u1398@jsp.umontreal.ca
Message-ID: <1991Nov21.180329.25409@jsp.umontreal.ca>
Source record: 46357

Hi, I'm finishing up my terminal program for the ST and I wanted to add a built-in LZH, ARC, ZOO and maybe even ZIP viewer. (A function that shows you the contents of the compressed file.)

So far, I have the LZH and ARC parts working, but can anyone suggest where to look the ZOO file format? I would need something that gives me direct information on the file's structure. Zip would be nice, too, but not nearly as important as ZOO. (Especially out here in Netland).

Any help apreciated.

>compiler to work properly. most frustrating.
>
The problem was that the alias for the names was not being set
properly. The environment variable GCCINC was not set properly.
gcc.ttp was terminating after the cpp pass silently because no
include files were found. [The gcc documentation uses the -v
flag. Very helpful]
>

> so elvis can resize the window.

I downloaded the sparc sources to mint to my unix machine
from flash.bellcore (archie told me that the address is
128.96.32.20 in pub/mgr.) Now if I can find the danged ms troff
macros I can get printouts of the mgr docmentation.

Is there any indications as to what parts of mgr got ported
to the ST? For instance according to the source code calling
m_getinfo with an argument of G_WINSIZE return lines and cols
in the form that vi/elvis already require.

if no init.prg exist then the desktop comes up?. hum have to try
that... Will mint be executing properly then?
>
> How does one access zoo under mint/ksh. The command "zoo a// zoo files"
> gives an error message "improper option \".

Mint .91 Zoo 2.1 Ksh as provided has only ksh.1 as documentation
no reference to unixcmd. unixcmd as quoted will still not create
a zoo file but will extract from a zoo file. Give that man half a
cigar.
>

On ST-1040 1 Meg with no accessories except auto-boot supra
and UIS III 780K.

On STE-1040 with ?2-1/2 Meg? no accesories except auto-boot ICD
and UIS III 1780K.

Is there a better way to determine memory availability?

> microemacs 3.10 (or .11) to mint/mgr yet?
>
Problem with Elvis right off the tape under mint is that
elvis has it's temporary file space as "%s\%s\Elv_%d" and
such like crap for it's files. When I get make working
under gcc, I'll fix that with tempname as a function call.

Also Elvis does not reference termcap but hardcodes the vt52
definatation into it's code. Altering the code to use curses
as supplied with mint and using environmental variables will
extend it's useful life under mint. Since the routines in
MicroEmacs 3.10H already use termcap on the ST as well as
the mouse routines, it should be easy to extract the
working routines to work with other code.

What documentation? Nothing mentions unixmode. And I use Ksh at
my real job (cause Csh doesn't really work well here.) I haven't
read the Mint-Bash documentation since I won't be using bash.

Why is the docs for ksh distr as ksh.1 in nroff.man format. Is
there a workable version of nroff for the ST? (Runoff is not acceptable)
Tex is also not an acceptable option except for the elite.)

Thanks for the info. But my problem has really nothing to do with this.
I just called Level 0 NMI, cause *it happens* although the SR mask is set
to $2300. This is so, since level 0 would mean all IPL lines are high,
meaning there aren't any interrupts.
Nevertheless I DO GET a Level 0 Interrupt. (or so I believe). How the
MC680xxx does this ? Read my previous post... (It's not a real interrupt!)

Sorry, the answers are No No and No again. The debugger has nothing to do
with it, the MFP works as well as in any other ST machinery (how well ?
that's my problem, maybe..), the GLUE is OK.

I might suggest that you try out the little program to witness the behaviour
yourself, if you don't have an assembler here it is UUENCODED.
-------- Cut here -------

[Inline uuencoded payload not displayed: x.prg]

-------- Cut here -------
I tried this years ago on my 520ST+, today on my MEGA ST-1 and on a
1040STE here at work, they all give the same result. So I don't think
it's machine dependent.

Doc: run it and move the mouse, till it bombs (less than 10 seconds)

Thanks for your response nevertheless.
I don't want to get on the nerves of Atari employees, but maybe one
of them has clue ?

Nat!

Cross-posted to: comp.sys.mac.hardware,comp.sys.atari.st.tech

I'm dumping my ancient Atari ST and buying an mac LC. Can I re-use the SM124 monitor on the mac as an extra display?

Those in comp.sys.atari.st.tech should be able to post the exact spec of the monitor (1985 SM124). I think the vertical scan rate is 71.25Hz.

Those in comp.sys.mac.hardware should be able to post whether any cards exist that can cope with it. (For the LC or `praps my mums Classic). I want to use the monitor in addition to the greyscale monitor, *not* instead of it.

Ta, Chris.

Mmm,

I feel somewhat disapointed by the net.
Few weeks ago I posted a message to the net (atari newsgroup also),
with the question if anyone knew if such a program was available.
I got no reactions at all!

So I started writing such a program and i am already halve way.
So I spoiled my time then:-(

>I'll eventually be distributing my modified version, which should support
>instrument / percussion remapping,

I have/had these in my program too, which will be finished (and tested!!)
in februari.
I planned too have features like:
setting initial voices (program changes) for each track,
modifying channels per track/channel,
filtering certain events out,
setting initial tempo for song,
setting relative tempo changes for the whole song,
editor to view (and in later version modify) midi events and midifile event (FF).
transposing note events (apart from percussion remapping).
etc.

So what should I do?

Finish my program or wait for your updates?

>--

This board has a custom MMU fitted to it, so I don't think its posible
to make your own memory boards..

Note: there is a German one that is very versatile from what I remember,
may be some of the German readers can post the info on it..??

gcc can't do anything useful with makefiles. You need 'make' in addition to gcc to make any use of them.

Does anyone know what this function does and where the sources and documentation for it can be found? It is part of the gnu c lib.

I haven't been able to find where the components that make up all the .olb files are kept.
Thanks..

GE-Soft in Germany have made a TT-ram card with 8 SIMM sockets. This card is populated with 14 IC's and I belive 10 of them have 44 pins. The card can hold 4MB, 8MB, 16MB, 20MB or 32MB of fastram.

Does anybody know how fast this card is compared to the original Atari card?

This is just a guess... but from its name I guess "strlwr" converts a capital letter to lower case. It seems to me it's the opposite of "strupper"

agian, just a guess 8*)

Hi
I have been a "loyal" Atari person for years,
ever since the 2600 first came out. I thought I would
send off a micro-flame to the people there. I just got
my official Tier II development system and have been
playing with it.

Anyone care to explain how they could give me a sample CPX
program that is not compilable with the C compiler they
provide?

Also anyone know how to get the Alycon C compiler to accept
"void". Yes, it might be hidden in the 3 manuals of docs I
have. I haven't gotten that far yet. I am just testing the
C compiler, pdmake, the sample CPX files.

Harry

Does anyone know how to persuade the GNU linker (gcc-ld) to tolerate doubly defined symbols? When a program contains a function whose name is identical to that of a library function, or when two libraries contain functions with identical names, it stops with an error message. It would make more sense to issue a warning message and use the first occurrence of any label, but I couldn't find an option to specify such a behaviour.

That is unacceptable. 'Warning' is not an error and can be suppressed by the compiler driver (gcc). But defining two identical functions differently is a simple mistake. All you can do to fix the problem is to let the linker show where these doubly defined functions are located more kindly. BTW, 'C' does not distinguish your own code from those written by others: there is no class distintion here. So, if you link someone else's code (perhaps you didn't write crt0.s or the C libraries), you are assumed to have written them and made to answer for them!

Tsuji

Hi Brain,

You need to run `make', not gcc. Make reads the makefile and will run gcc and whatever else it needs to build the target(s) specified in the makefile.

Cheers,

It seems to be perfectly acceptable to other linkers, so why should
the GNU linker be an exception?
Maybe there was some misunderstanding as to the purpose of allowing
doubly defined symbols. All I want is to have optional replacements
for standard library functions, mainly GEM functions. For example,
I have my own version of form_do(), which has exactly the same
prototype, but adds some convenience for users (like keyboard
equivalents for operating buttons). My programs simply call
form_do(); if I want the more elaborate version, I simply add
my own library (which nothing else but form_do(), so it is no
replacement for the GEM library) during linking and expect the linker
to take the first occurrence of form_do() and ignore possible
later definitions.

harryu you were almost right: strlwr converts each upper case
albhabetic character in a string to lower case. it checks that
something is actually a upper case char before conversion, so it
leaves the rest alone.

the components that make up a olb are object files, that are
compiled images of the library sources, that are there on A.A. the
documentation is in a seperate sub directory. sorry, i dont have ftp
access so i cant tell where exactly the stuff is.

4141. Mega STE LAN port

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-23 20:28:19 UTC
From: ignac@electro.electro.com
Message-ID: <1991Dec23.202819.22842@electro.electro.com>
Source record: 46372

Is there any available information about the LAN port that exists on
the Mega STE and the TT?? ie: baud rates, type of handshaking used,
protocols supported, addresses to write to to access the port, etc.

any information would be appreciated. thanx in advance.

ps: has anyone had any dealings with a company called Application
Design Software from Merlin OR, USA?? they supply a product called
the Universal NETwork v1.1. has anyone used it??
it is supposedly driver software for the
LAN port, although the quoted price i've seen of $220 seems to be a
bit too much for only 2 nodes, since it's strictly software.
(hence the initial question!! - why buy it if you can write it yourself!)

happy holidays!

Agreed!
If they are found in ordinary object modules, NOT in libraries!

> All you can do to fix the problem is
> to let the linker show where these doubly defined functions are
> located more kindly.
I wold like the linker to differetiate between libraries
and other (object-) modules!
It seems unacceptable to me, to tear apart and put together again
the whole library if one want's to replace a library-function
by a sligthly different one.

> BTW, 'C' does not distinguish your own code from
> those written by others: there is no class distintion here.
This is not a problem of the language, but one of the linker.
(the tool!)

Source record: 46374
Cross-posted to: comp.sys.mac.hardware,comp.sys.atari.st.tech

I was asking about using my ST's old SM124 on a mac LC as a second monitor.
I now have the specs for my SM124. (thanks to <d.jewell@trl.oz.au>) :-

>The vertical for the ST is 71Hz; the LC's mono monitor is 66.67Hz.
>The horizontals are 31.5kHz and 35kHz.
>I am hoping that the SM125 can be adjusted to the frequencies as they are close

However the point has been made that using it as a second monitor is
probably not economic. (thanks to <ingemar@se.liu.isy>) :-

>I don't think it is worthwile, even if it can be done. In order to have
>two monitors, you *must* add a video card, and that will cost much more
>than a monitor does.

Ok. So can the SM124 be adjusted to be used *instead* of the Apple 12" mono.
The timings are close, are they close enough? I know the 12" is nice, but
saving the money is too. The SM124 is only B/W, *not* greyscale, but I've
heard of conversions being done. Is is possible? Go on tell me the inevitable.

4144. Megafile 30 doesn't boot

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-24 09:03:51 UTC
From: stefan@spc.nl
Message-ID: <1991Dec24.090351.8801@spc.nl>
Source record: 46377

About a year ago, I bought a Megafile 30 for my Mega 2. Fine, it worked perfectly until about a month ago. When I want to work with it now, I have to switch the computer and the hard disk on and off about a dozen times before it boots from the hard disk. When it doesn't boot, I also cannot install it by running the hard disk driver, when I do this the drive light will stay on, and it doesn't recognize the disk. The strange thing is that when it refuses to boot, the light does flicker when I turn on/off/reset the computer.
So what's going on here? Broken cable? Hard disk screwed? Or does it just have to warm up or something?

Email me if you can shed some light on this...

Thanks,
Stefan

In article <UipuH5/3o7I@lionbbs.bs.open.de> UweKloss@lionbbs.bs.open.de (Uwe Kloss)
writes:

wait a minute, there seems to be some confusion here. The linker does
distinguish between object files (.o's) and libraries (.a's or
.olb's). The thing to remember is that the linker cannot split up or
selectively pull out symbols from a .o file even though it comes from
a library. If a symbol is referenced and it is in a .o file which is
in a library, then the whole .o file, with all its symbols, referenced
or not comes in. A good way to figure out exactly what the linker is
doing is to run gcc-ld with the -M option like
gcc-ld -M -o foo.tto $GNULIB\crt0.o fo.o bar.o -lgnu
(note that you cannot pass the -M option to gcc-ld via the driver
gcc.ttp because -M means a different thing to gcc.ttp).

hope that helps,
cheers,

4146. How do I restore brightness to my SC1224?

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-25 22:33:20 UTC
From: bcc@Eyring.COM
Message-ID: <1991Dec25.223320.10568@Eyring.COM>
Source record: 46384

Some time ago my color monitor went dark. You could see the icons in a room with the lights out, and when you turned the monitor off, the screen flashed white briefly, so I knew that the the high voltage wasn't gone, but it acted like the brightness control was turned way down. Except it wasn't. I took it to the only guy in town who does Atari service, and he said he thought the tube was 'gassy', made some sort of adjustment, and gave it back to me.

Problem: The screen is still rather dark, and any game that uses a black screen now has retrace lines on it. The brightness control on the front has little if any effect. I hate the color. I always thought a tube went gassy over a long period of time, while this happened overnight. Is there a failed component in the control circuitry that I can replace? I know about the dangers of High Voltage in the case, but I'd be willing to brave it if I knew what to look for. (I built two H-19 terminals in my kit-building days.)

For identification, the monitor was made in Korea, February 1987, and has the push-button on/off switch in front. Thanks!

From: bill@mwca.UUCP
Message-ID: <1945@mwca.UUCP>
Source record: 46388

I recently posted that after increasing a buffer size to greater than 65535 in Midiplay that it would exit with two bombs. Steve Yelvington helpfully replied that malloc() only dealt with 16-bit values, and to use lalloc(). I checked the source, and sure enough there was one malloc() in there, even though all the others were already lalloc(). I changed it, everything works fine now.

Now all I have to do is add the code to do drum/program change remapping on the fly from MT-32 to my synth (and eventually allow for translation tables so anyone can use it...).

Source record: 46385

I'm thinking of putting fast RAM into my TT4. Does anyone know the
current going prices for the boards, and are they available UNpopulated?
Last I heard, they were around $550US for 4 megs (rip off)...

On the subject of TT's, anyone know the deal on the internal floppies on
the 'old' TT's? Is the drive 1.44 or not? Can the chip handle 1.44?
Can TOS 3.01 handle 1.44?

Speaking of TOS, does anyone know if there is ANY possibile way to
upgrade to 3.06? Thanks in advance!

alcyon does not recognize "void" (at least it does not up to version 4.14).
the usual workaround is:

#define void int

or the "equivalent" typedef. good place to put this is common header like stdio.h. i think the 4.14 preprocessor (cp68) recognizes the symbol ALCYON (i patched mine to recognize that and more so i am not sure what was originally recognized) so this might be better with:

#ifdef ALCYON
#define void int
#endif

you might consider sozobon, the alcyon clone, instead. it is supported and free. alcyon is neither. soz comes with source, too. it might support void (i don't know for sure).

RE: printing Calamus files on other Machines.....
Sob, Sob, That's about all I can say for Atari Support in this country,
I am in the thick of doing a newsletter for project Jonah, before I get
Tooo Carried away, I want to be sure I can get the final produst
printed, I know that Calamus files don't talk to Postscipt machines but
the only place I can get things printed is on IBM/MAC equipment, I have
access to ST running magic sac if that helps, HELP, is there a way to
convert Calamus files to something more standard.....

PS. Does/Has anyone ever used one of the dual 5 1/4-3 1/2 drives on there
ST, are they any GOOD, Can you boot 8-bit software, and what about IBM
5 1/4 inch disks, Compatible, or just a pain....

Thanking you in advance--Why does everyone say that--Not original
Fletch, Ursulus to me mates

>access to ST running magic sac if that helps, HELP, is there a way to
>convert Calamus files to something more standard.....

No, there really really is not, Calamus just plain sucks in this area, absolutely NO outside compatibility, as in zip, zilch, zero... You have to use other conversion programs to import .TIF files or Postscript fonts (what a pain in the ass). The nice points of Calamus are great of course, but output is simply limited to other Calamus-running machines. I would suggest one of two things:

1) The cheaper way... Find someone who is running Calamus hooked up to a HP LaserJet III. The LaserJet III looks just great, and getting the output from it would be very cheap.

2) Call ISD... They have a list of places you can call (One of them actually exists in the USA!) that have Calamus hooked up to a Lino or other typesetter. You will have to send your disk off to them, and have them print it, and then send it you back the output.... (great huh?)

Good luck...

By the way, you really should read my cool .sig file ;-)

Source record: 46244

Can someone please e-mail me information on Atari USA's current Developers' program? (Last time I checked, you *had* to either already have a commericial product out or have one in development. This was several years ago though. Has this changed?)

Anyways, names, addresses and amount of money (along with minimum requirements for getting into the program) would be much appreciated!

Thanks!

I have a problem with AT SPEED. It's just NOT RELIABLE. This is quite a
crucial problem. I boot it from my megafile 44, and especially at the start
of a session it just will not boot. The screen just turns blank and that's it.
When I hit the computer, it will start, however this is not a satisfactory
longterm solution to me. Also after some time in operation it just locks
up. The keyboard does not work etc etc. I'm beginning to get a little tired
of this problem and Compo software, who distribute the product in Holland,
and everywhere else I believe, have not responded to this and several other
of my questions.
Does anyone have similar problems? I installed AT Speed myself, and I
can say that all connections are sound. It has been installed in a mega ST2
so temperature should also not be the problem. Please help before I go
completely nutty and bash my ST to little BITS.

I have bought AT Speed and received DR DOS 5 along with it. How the xxxx do I get it to swallow another DOS version??? I have tried a zillion times now with different system disks (I told ATSpeed that it had to start from disk instead of HD) to get it to start MSDOS but the system just locks up (another great quality That occurs a lot on my ST/AT). When I simply replace the system files with other system files (like command.com) it will reply 'incorrect DOS version'. How do I tell it to xxxx xxx and just load the new DOS?? As you can see I'm in the process of loosing my patience. I could never have dreamt that the whole PC / MSDOS environment was this bad. Try installing a program, for the ST usually no more than copying a file or two to HD, but with a PC....nightmares!!! Please save my computer from my destructive temperament, if you could help out with the above problem.

Cross-posted to: comp.sys.atari.st.tech,comp.periphs.scsi

I have an old Adaptec 4000A, which I understand to be a SCSI-to-ST506(MFM) interface. My ISA bus 486 PC currently has an Adaptec 1542A SCSI adapter installed, cabled to just a SCSI tape drive. The hard disk currently in use is just a single IDE drive. I'm running Microport SVR4, and I need more HD space. I was wondering if it was possible to use the old Adaptec 4000A to access a couple of my old 40 MB ST506/MFM drives which are just lying about gathering dust. The Adaptec 4000A came out of an Atari ST SH204 hard drive box, and it has a PROM with an Atari label on it. Does anyone know if this would work as is, or would it require a new PROM or a custom SCSI driver, or something else equally unavailable?

Thanks,

Bob

You could always try PageStream... However, if you really love Calamus, you probably won't like PageStream much. The differences could be described thusly:

Calamus does everything that it does very well and very quickly, even though it has some limitations in some areas.

Pagestream tries to do everything, but does not end up doing them nearly as well or as quickly (it is very slow). Pagestream also has more bugs.

However, Pagestream does have more features than the standard calamus, but naturally lacks exactly those features that would make it and outstanding program. Calamus on the other hand is an outstanding program but with such limitations in the output as to make you wonder why they bothered to write such a beautiful peice of software in the first place. Calamus SL is still not out in the US, but it is a really nice package, features to blow away everything without exception, and a price to match...

Anyway, if you NEED postscript output, get Pagestream, but be prepared... It is radically different from Calamus, and the slowness of the program will make you want to scream!

By the way, you really should read my cool .sig file ;-)

4159. Mega STe and STe GST shifter numbers....

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-30 20:11:00 UTC
From: pegram@uvm-gen.UUCP

Source record: 46247
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Quite some time ago, Lars-Eric Osterud noted that newer Ste's and Mega Stes have problems with noisy DMA sound, with displaying Spectrum 512 pictures and with mono screens wrapping left if a program abruptly changes the display address. Sure enough, I noticed the problem on my STe using Lars' noisetracker player program, and with the Codehead's Artgallery program (a picture "slide-show" program). The mono wrap left is harmless - it'll switch back and forth between normal and wierd - but rather annoying.

Unfortunately, Lars is not a hardware hacker and while he noted that the chip in question was in location U401 on Stes, he did not get the Atari chip numbers of the good and of the offending chips. To make a long story short, I finally pried the right chip out of Best Electronics and can give both numbers.

Bad new Shifter chip: C301712-001

Good older shifter : C300588

This is the largest PLCC (plastic leaded chip carrier - aka socketed square chip) on the motherboard, at 80 pins, rather than 64 pins.

Right now, I'm missing one chanel of DMA sound (I hope I just mis-inserted the chip!), but I can display Spectrum pictures (checked at a friend's house) and my mono display is rock solid.

Good luck folks and enjoy my belated Christmas present.

bye,

Bob Pegram

P.S. I'll be trying to find out about MiNT and MultiGem soon - I have to clear off my hard disk before adding things! don't get your hopes up, MultiGem looks to be very much a ROM version specific "enhancement" (1/2 8-). RBPIII

Just an extra twist here -- My 4-megabyte 520STe had a similar problem
(bad displaying of Sperctrum 512 pictures), so following the net.advice, I
took it to the dealer have the shifter chip changed.

I was surprised to find, however, that on my machine there was NO shifter
chip! Rather, the shifter was an integrated part of a larger IC, so I
couldn't just "pop out the bad, pop in the new". Fortunately, my dealer was
nice enough to swap my motherboard for another that had the "right" shifter.

This is just to let anyone else out there know that, depending on what
'board you have, your shifter problem may not be so easily solved. Now my
Spectrum pictures display properly, though I can't say anything about DMA
sound or mono display shifting.

Well, as a happy owner of MultiGEM, I can tell you that it's not a ROM
version specific "enhancement". It claims to work on any version of TOS
from 1.2 and up, and so far it seems fine. I did have problems porting it
from TOS 1.62 to TOS 1.6, but I re-installed the program and it worked great.

I was informed that GFA Basic 3.6 will not work on a 1040 STE and that
the compiler for this version will only work on the TT.
The version that I (having a 1040 STe) would require is 3.5.

Can anyone out there verify this for me before I buy the package? (Can't
afford the long distance phone call to GFA to find out).

Thanks much.

4162. SH204 hard drive comatose -- help!

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-31 04:57:13 UTC
From: kgg@mv.mv.com
Message-ID: <1991Dec31.045713.6161@mv.mv.com>
Source record: 46249

I have a 1040 ST w/ 1 Mb ram and 20Mb SH204 hard disk.
A while ago, a got a couple more cherry bombs than usual for a day,
decided to shut the beast off for the day and come back the next.
A month went by before I got the chance to power up again.
When I did, the hard disk spun up okay, but didn't go
through the self test. I forget what the screen showed, if anything,
when it warmed up, but it wasn't good. So I hit the boot button
on the back of the CPU. No dice. Without the HD, it wouldn't boot.
So I turned off the disk, rebooted w/o it.
That worked fine except that Drives A and B are present (and work),
but while drives D and E appear on the screen they don't work,
and drive E neither appears on the screen nor is accessible.
I believe I tried mounting it 'manually', but that didn't work either.
So, at the moment, I'm limping along w/ just the onboard floppy drive,
using it as a terminal to get to the machine from which I'm posting this.

Does this sound familiar to anyone?
Anyone have any idea what the story is?
Is it possible to get the drive going again at all?
Is it possible to get the drive going without losing data?

Thanks,
-- Kenn Goutal

If you mean that the larger chip was soldered in, my
condolences, else my advice still applies. I paid $40.00 U.S. for the
entire "larger IC" and it just popped in <grin>.

I then wrote:

Sorry, R. J., but you rather proved my point above - you have
to reinstall for each new version of TOS. Has anyone gotten MultiGem
to run on TOS 2.0X?? I have MultiGem, just not installed. I took a
look at the install disk when I came up with that opinion, and no less
an authority on such things than our Mike Vederman (8-) declared
MultiGem a hack. DC Desktop and some other DC products tend (not always
guys, I know that!) to be TOS version specific hacks too. I mean that
the software works everywhere, but a lot of extra code for each set of
ROMS is included in the package for installation purposes. I only
object when conflicts arise, and unfortunately, one I was unprepared
for, did 8-(. Ahem, Mike V, will you ever get DataDiet to work with
MultiGem? Guess who got both programs at once 8-).

bye,
Bob Pegram

Oh, I see -- I thought you meant that MultiGEM would run _only_ on
TOS x.y. I never considered re-installation to be a major problem, myself.
All I know is that, while it's not perfect, I do think MultiGEM comes
closer to all-purpose multitasking on the ST than any other commercial
product that I've seen.

4165. Atari Portfolio archive at umich up to date

Newsgroup: comp.sys.atari.st.tech
Date: 1991-12-31 20:31:44 UTC
From: swood@terminator.cc.umich.edu
Message-ID: <1991Dec31.203144.1515@terminator.cc.umich.edu>
Source record: 46256
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.laptops,comp.sys.handhelds

Well, I have been real busy with non-archive concerns as well as plagued with tons and tons of problems that have made it hard for me to do anything but paltry updating on the boondoggle of incoming files at the portfolio archive. But I just spent my New Years Eve working away into the wee hours of New Years Day updating the whole shabang.

I have changed the format of the majority of the files over to .lzh as this is the smallest compression type I could find and it seems to be resonably well supported, even though there are a few problems with compatibility between some versions. If this causes problems for anyone, let me know, as I have considered converting the whole thing (yes once again) over to zoo as it is almost as small, but a bit more supported. The only reason I haven't yet, is that I have not found a zoo archiver for the portfolio.

Another thing. As you are looking through the archive, if you come accrossed any files (.lzh) that have real messy filenames, please let me know. Seems that weiner's version of lharc likes to garble file names beyond all recognition upon compression into the archive. I think that I got to most of the ones that I did it to, but there might be a few that I missed.

Lastly, I accidentally deleted a few files in the process of shuffling things around, and I managed to recover all of them but one. If the person that sent me the copy of ptetris could please send me the copy of the file again, it would be greatly appreciated.

Otherwise, feel free to send more files. Now that I am once again up to date, I should be able to keep up with them faster. And feel free to forward any questions my way. If I can't answer them, I should be able to find someone who can.

swood
